FOREWORD

In 1956, the State Legislature declared:

"... that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial use therein ..."

The Department of Water Resources was directed to conduct the necessary investigations to compile this information.

For purposes of these studies, the major drainage areas of the State were delineated. Division of these drainage areas into subareas, designated hydrographic units, was then made. The hydrographic units, which generally comprise watersheds of individual rivers, serve as the basic unit for collection and reporting of data.

The investigation is being conducted in two phases: (1) collection and publication of data on land and water use, and (2) determination and reporting of water resources and future water requirements. Collection and processing of basic data for both phases, by hydrographic units, is underway in much of the State.

The land and water use and land classification data are being published as the Bulletin No. 94 series, covering individual hydrographic units. These bulletins are distributed in preliminary editions and reviewed at public hearings. Final editions are then published including summaries of the hearings and resulting revisions. These bulletins are an essential source of data for the subsequent water requirements studies, and when complete, will provide detailed data for the entire State.

This report is the fourteenth of the series and is the preliminary edition of Bulletin No. 94-14 preceding public hearings to be held in the American River area in 1965.

The second phase of the investigation begins with an inventory of water resources in each drainage area, including streamflows, ground water, and water quality characteristics. Estimates of future water requirements, based on the land and water use studies and projections of foreseeable future development, are now underway in some areas. Results of these

water resources and water requirements studies will be published as Bulletin No. 142 series, each covering some or all of the hydrographic units within a drainage area.

These water resources and future water requirements bulletins will provide the basis for outlining the additional projects needed to meet the State's growing water needs. By interrelating the projected water requirements of all areas of the State with the available local supplies, by decades, a recommended sequence and timing for the State's future water development plans will be established. Besides thus forming the chief basis for the Department of Water Resources' all-important project staging program, the data on water resources and water requirements will be a most valuable guide for water development planning by federal and local, as well as state agencies.

DEPARTMENT OF WATER RESOURCES

P. O. BOX 388
SACRAMENTO

August 12, 1964

Honorable Edmund G. Brown, Governor
and Members of the Legislature
of the State of California

Gentlemen:

I have the honor to transmit preliminary report Bulletin No. 94-14, entitled "Land and Water Use in American River Hydrographic Unit," the fourteenth of a series of reports of the Department of Water Resources, which present detailed basic data of land classification and use, water use and apparent water rights within certain hydrographic units of the State. The bulletins also include detailed maps depicting land classification and present land use, and discuss history, natural features, climate, and economy of the units. These studies are conducted pursuant to legislation sponsored by Senator Edwin J. Regan and codified under Section 232 of the Water Code.

The information contained in this series of reports will provide a basis for future estimates of the amount of water which can be used beneficially within each area. From these estimates, the amount of surplus or deficiency in each area will be determined. The completed series will provide invaluable reference material for relating our water resources to areas of use.

All public and private agencies, local interests, and individuals who may be concerned with the information presented herein are invited to submit their comments. A public hearing will be held after due notice to receive comments which will be considered in preparing the final report.

Sincerely yours,

A handwritten signature in cursive script, reading "B. Q. Goldberg".

ACKNOWLEDGMENT

The Department of Water Resources gratefully acknowledges the contribution of information by the numerous water users and residents of the American River Hydrographic Unit and by agencies of the federal, state, and local governments.

Special mention is made of the helpful cooperation of the Forest Service, United States Department of Agriculture; Placer County Water Agency; Pacific Gas and Electric Company; Sacramento Municipal Utility District; El Dorado Irrigation District; Foresthill Public Utility District; Georgetown Divide Public Utility District; and the Farm Advisors of El Dorado and Placer Counties.

CHAPTER I. INTRODUCTION

This bulletin presents basic data on land and water use in the American River Hydrographic Unit. These data cover present land and water use, classification of lands, systems used to divert surface waters, histories of diversions, apparent water right pertinent to each diversion, purpose and extent of use of diversion, seasonal quantities of water diverted during 1960 and an estimate of present consumptive use of water in the unit. A general description and brief history of the area are also included.

These basic data were gathered during the period 1959-62 in compliance with Chapter 61, Statutes of 1956, as amended by Chapter 2025, Statutes of 1959, and codified in Section 232 of the Water Code of the State of California. This legislation provides for an inventory of water resources and water requirements of the State. This is the fourteenth in a series of bulletins being prepared under this authorization. The text of Section 232, with a discussion of its history and implications, is included in this bulletin as Appendix A.

These data provide the basis for future determination of the quantities of water reasonably required for future beneficial use in the American River Hydrographic Unit. Estimates of these quantities have been made and presented in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," June 1955. Final

determinations of future water requirements will be based on estimates of: (1) future land use, (2) economic patterns, (3) population, (4) industrial and agricultural development, and (5) recreational needs.

Organization of Report

This bulletin consists of five chapters, five appendixes and three plates. Chapter I contains a general description of the American River Hydrographic Unit. Chapter II presents data on present uses of water and includes information pertaining to surface water diversion systems, water rights, quantities of water diverted, and consumptive use. Chapter III includes a history of land use within the unit and a tabulation of present land use. Chapter IV includes an explanation of land classification criteria and a tabulation of lands classified with regard to their potential for irrigated agriculture and for recreational purposes. Chapter V summarizes the data presented in the bulletin.

Appendix A presents the text of Section 232 of the California Water Code and a discussion of the pertinent responsibilities and work program of the Department of Water Resources. Appendix B lists related investigations and other references pertinent to the American River Hydrographic Unit. Appendix C, "Legal Considerations," presents a short summary of California Water Law, a review of litigation involving water rights in the American River Hydrographic Unit and a tabulation of applications to appropriate water in the unit.

Appendix D, "Detailed Descriptions of Certain Surface Water Diversions," presents details of diversion systems which could not be adequately described in tables contained in Chapter II. The diversions are arranged alphabetically by owner or operating entity. Appendix E presents descriptions of facilities recently completed and under construction by other agencies.

Plate 1 shows the location of the hydrographic units north of the Tehachapi Mountains and the present status of the land and water use investigations leading to the publishing of the Bulletin No. 94 series of reports. The location of the subunits within the American River Hydrographic Unit is also shown. Areas of present land uses and the location of diversion systems are shown on Plate 2. The classification of lands is shown on Plate 3.

General Description of Area

Location and Extent

The American River Hydrographic Unit, shown on Plate 1, "Location of Unit," is situated within the Sacramento River Basin on the western slopes of the Sierra Nevada Range. The hydrographic unit comprises that part of the American River Basin above Folsom Dam. The unit is roughly 50 miles in width at the crest of the Sierras, narrowing to about 3 miles in width at Folsom Dam, and is approximately 60 miles in length. It contains 1,863 square miles of drainage area. The major area is in El Dorado and Placer Counties, with the small remaining area in Alpine, Amador, Nevada, and Sacramento Counties.

Folsom Dam
and Reservoir

Recreation at
Folsom Reser-
voir

The hydrographic unit is bounded on the west by Folsom Dam and the watersheds of minor streams tributary to the Sacramento River; on the northwest and north by the Yuba and Bear Rivers; on the east by the Truckee River and streams tributary to Lake Tahoe; on the southeast by the Carson River; and on the south by the Cosummes and Mokelumne Rivers.

For purposes of this report, the American River Hydrographic Unit has been divided into 11 subunits as shown on Plate 1, "Location of Unit." The area of each subunit is shown in Table 1.

Historical and Present Development

The early development of the American River Hydrographic Unit came as a result of individuals seeking profit from the abundance of natural resources of the area.

In 1828, while opening the coast route to Oregon, Jedediah Smith and other trappers of the American Fur Company, are reported to have traversed the lower edge of the unit and found gold. An expedition sent by the fur company to develop the gold was massacred by Indians. In 1844, John C. Fremont passed through the American River Hydrographic Unit while on a government surveying party.

John Marshall's historic discovery of gold near Coloma in January 1848, triggered the start of rapid development within the hydrographic unit. In 1849 and the early 1850's, thousands of miners and prospectors responded to the call of gold. It is estimated that about 50,000 persons migrated into the American River area during the early years

of the gold rush. The population of El Dorado County jumped from virtually zero to over 20,000 persons in 1850.

Much of the mining in the unit took place in the Iowa Hill, Volcanoville, Yankee Jim, Dutch Flat, and Forest-hill areas of Placer County and the Georgetown, Kelsey, and Placerville areas of El Dorado County. During these early years, the miners worked the available surface deposits individually. These easy-to-obtain shallow river gravels soon became exhausted, and it was necessary to wash larger and larger amounts of gravel for profitable operation. Other mining methods were developed and tried. Among these were the miner's cradle and sluice box. Later ground-sluicing methods were used, and finally hydraulic mining was developed. Each of the new methods required increasingly larger amounts of water.

Hydraulic mining was developed in the Nevada City area by Edward E. Mattison in 1853. He found that by using a hose and nozzle, a stream of water under pressure could be used to undermine and wash the gravel into sluice boxes. This was a great improvement over earlier methods and led to the construction of many small dams, reservoirs and canals to supply the water and pressure. One of the first organized groups to develop water was the Rock Creek Water Company, a predecessor of the present day Georgetown Divide Public Utility District. Other agencies and groups of individuals soon followed suit.

Hydraulicking, though a boon to gold mining, proved to be a detriment to agriculture and a hazard to river

navigation. The discharge of mining debris to the streams caused the low-water plain at Sacramento to raise 5 feet or more by 1879. This resulted in more frequent flooding of the adjacent agricultural lands. The damage caused, not only at Sacramento, but in all the lowlands, resulted in a Federal Court injunction in 1884. This court decision, handed down by Judge Lorenzo Sawyer, prohibited all hydraulic mining in areas tributary to the Sacramento River except that done behind a retaining wall or dam. The increased cost of operation required to comply with this injunction and a static price for gold resulted in an almost complete cessation of hydraulic mining. In 1893 the United States Congress, through the Caminetti Act and its amendments, created the California Debris Commission to study practical methods whereby hydraulic mining could be resumed. Although the commission was not successful in restoring hydraulic mining to its former pre-dominate position in the local economy, it still licenses hydraulic mining operations and requires that they be carried on behind debris control dams. The commission constructed one debris control structure in this unit, the North Fork Dam on the North Fork American River.

Following the Sawyer decision of 1884, gold mining declined and mineral output remained relatively low in the unit until the depression of the 1930's. The high price of gold guaranteed by the federal government during the depression caused a revival of gold mining activity. With the stabilization of the price of gold in 1933, gold mining again declined. About \$10,000 in gold was mined in El Dorado County in 1959.

Although in the past gold has received most of the attention in the American River Hydrographic Unit, other minerals and mineral products have had a substantial impact upon the economy of the unit. The more important of these are: limestone, slate, sand, gravel, and crushed stone. In addition, copper, clay, asbestos, and chromite have been mined within the unit. Small amounts of both coal and iron were mined in the late 1880's. The post World War II building boom gave rise to an increase in the production of such commodities as limestone, shale, and crushed stone used extensively in the building trades. In 1959 crushed stone accounted for over 66 percent of the total value of El Dorado County's mineral production.

Agricultural development closely followed the discovery of gold, spurred by the attendant need to supply the demands of the mining population. In 1849 and 1850 the first planting of potatoes and other vegetables in large patches was attempted in the vicinity of Union Bar and Coloma. In 1851 the first attempt at raising grain was made by William Crone who planted barley in Greenwood Valley. Fruit trees, first planted in the Coloma area, were also cultivated at Gold Hill, Pilot Hill, and near Placerville.

From 1850 to 1870, as mining activity declined, substantial acreages were cultivated within the small valleys in the lower elevations of the unit. Many of these areas were irrigated using the ditches previously built for mining purposes. As early as 1855 more than 8,000 acres of land had been fenced, with nearly 5,000 acres under cultivation in

El Dorado and Placer Counties. Of the cultivated acreage about 3,000 acres were planted to wheat, barley, oats, and hay. In the late 1880's orchardists began to utilize the still existing mining ditches for irrigation, and by 1920 pears had become the predominant crop with an estimated acreage of 5,000 acres.

In the American River Basin, lumbering is the principal industry, with large stands of timber found at altitudes above 3,000 feet. Ponderosa pine is the predominate species below 6,000 feet. Sugar pine, white fir, Douglas fir, and incense cedar occupy smaller but profitable stands between the 2,000- and 6,000-foot elevations. Above 6,000 feet the principal species are red and white firs.

Timber production in the unit first began in conjunction with mining operations. During the first years of the gold rush, timber was used mainly for buildings and for fuel. With improvements in mining techniques, timber was also utilized for rockers, troughs, shoring timbers, and flumes. With the discovery of silver and gold in Nevada, lumber from the upper reaches of the unit was shipped into the mining areas of Virginia City and Carson City. In 1855, there were at least 40 sawmills in the unit. By 1870, due to decreased mining activity, sawmills declined in number to about 25. There are approximately 130 timber operators in the unit. The majority are small operators engaged in logging only. The largest operator, as reported in 1960, was the Michigan-California Lumber Company, located at Camino, with an output of over 69,000,000 board-feet. Other large operators are the

Stockton Box Company and Hughes Brothers both at Foresthill and the Placerville Lumber Company at Placerville and Smith Flat. Almost all of the manufacturing activity within the unit is attributable to these lumber firms. In Placer County during 1956, 38 of the 57 manufacturing firms were engaged in lumbering activities. Since the four firms mentioned account for approximately one-third of the salaries and wages within the hydrographic unit, the impact of the lumbering industry on the economy of this unit is evident.

The American River Basin is extensively used for recreation. The most intensive recreational use is found at Folsom Lake and in the areas adjacent to U. S. Highway 40 and U. S. Highway 50. The headwater streams of the river system are extensively used for trout fishing. To supplement this heavy pressure the State Department of Fish and Game has conducted a trout planting program for many years. In the lower reaches of the unit, migratory species, principally salmon and steelhead were an important fishery before the completion of Folsom Dam.

Other recreational activities, in addition to fishing, include camping, picnicking, vacationing, swimming, and boating in the summer, and skiing in the winter. All of the winter recreation takes place along and adjacent to U. S. Highway 40 and U. S. Highway 50, as other roads are generally inaccessible. Recreational use in El Dorado National Forest during 1960 has been estimated at 1,900,000 visitor days.

Water development in the American River Basin began in the mid 1800's to supply the mines. Early development

consisted of small diversion structures and mining ditches. About 1870 the Rock Creek Water Company, a predecessor of the Georgetown Divide Public Utility District, constructed a small timber crib dam on Gerle Creek to form Loon Lake. Releases supplied the Georgetown Ditch previously constructed in about 1850 for mining purposes. In 1881-82 the crib dam was replaced with a masonry dam increasing the storage capacity to about 8,000 acre-feet. Recently, the Sacramento Municipal Utility District completed construction of a new dam at Loon Lake with a storage capacity of 76,500 acre-feet as part of its comprehensive American River hydroelectric development project.

Present development on the North Fork American River consists of Lake Valley, Big, and North Fork Reservoirs, which have an aggregate storage of about 25,000 acre-feet. Regulated releases of water from Lake Valley Reservoir are conveyed by natural watercourse and conduit to the Drum System of the Pacific Gas and Electric Company for generation of hydroelectric power, irrigation, industrial and domestic use.

On the Middle Fork system, present development consists of Loon Lake which serves the Georgetown Divide area with irrigation and domestic water.

Existing water developments on the South Fork American River are the hydroelectric power facilities of the Pacific Gas and Electric Company and the irrigation facilities of the El Dorado Irrigation District. Storage releases from Silver Lake Reservoir and Twin Lakes Reservoir on the Silver Fork, and Medley Lakes Reservoir on Pyramid Creek, regulate flows in the South Fork. The El Dorado Ditch, which diverts

Camping

Fishing

from the South Fork, supplies the major irrigation and domestic uses of the area from Pollock Pines to west of Placerville. The ditch flow is regulated enroute by the El Dorado Forebay which diverts the bulk of the flow to the El Dorado Powerhouse, located on the south bank of the South Fork American River. This plant has an installed power capacity of 21,000 kilowatts. About 4 miles below the plant, flow is again diverted to the American River Flume which conveys it some 12 miles downstream to the American River Powerhouse. This plant has an installed power capacity of 5,600 kilowatts. Additional irrigation supplies for the El Dorado Irrigation District are received from Jenkinson Lake on Sly Park Creek via the Camino Conduit, from Weber Reservoir on Weber Creek via the New Weber Ditch, and from the Cosumnes River via the Diamond Ditch.

Sacramento Municipal Utility District is currently constructing a multi-stage hydroelectric project on the Middle Fork and South Fork American River system. The project is discussed in Appendix E.

Existing developments on the main stem of the American River consist of Folsom Dam, Reservoir and power facilities. Folsom Dam is a major feature of the Central Valley Project with primary purposes of flood control, power, navigation and water conservation for irrigation, municipal, industrial uses and salinity control. The reservoir has a storage capacity of 1,000,000 acre-feet and the power facilities an installed capacity of 162,000 kilowatts. Diversions are made from Folsom Reservoir to Hinkle and Baldwin Reservoirs which serve the San Juan Suburban Water District, and by pipeline

Ice House
Reservoir

Courtesy of Sacramento Municipal Utility District

American River
Flume

to the existing Natomas Ditch which was formerly served by a gravity diversion out of the South Fork American River. Both of these diversions serve lands in the Sacramento Valley Floor Hydrographic Unit.

Natural Features

The American River Hydrographic Unit is a generally mountainous area with elevations varying from about 225 feet in the vicinity of Folsom Reservoir to 10,380 feet above sea level at Round Top Mountain, in the southeast corner of the unit. Valley and foothill lands constitute only 0.3 percent and 27 percent, respectively, of the total area. The development of agricultural lands has been largely confined to those lands at the lower elevations along U. S. Highway 40 on the north, areas in the vicinity of Greenwood and Cool, and along U. S. Highway 50 on the south.

The hydrographic unit lies on the western slope of the Sierra Nevada Range, extending to the edge of the Sacramento Valley Floor. The Sierra Nevada Range is essentially a tilted block fault, dipping gently beneath the sediments of the valley floor on the west, and descending abruptly into the Great Basin Region along a series of bold fault scarps on the east. The geologic age of the basin formations vary from Mississippian to Recent. The oldest formations lie in a northwest-trending zone part way up the west slope of the mountains, where they have been folded and metamorphosed by the intruding granitic mass which forms the core of the range. The granitic core is exposed at higher elevations throughout

Silver Creek
Canyon

Courtesy of Sacramento Municipal Utility District

High Sierras

most of the range. Many of the larger ridges are capped by Tertiary volcanics and/or gold-bearing river gravels. The present stream channels are filled with Recent boulders and gravels.

The peaks on the crest of the Sierras in eastern Placer County show evidence of Pleistocene glaciation in the upper elevations. The general region is not strongly active seismically, although numerous faults are known to exist within the American River Basin.

Soils of the American River Hydrographic Unit can be broadly described as falling into three major zones dependent on their present and probable future use. These three zones are the Foothill Zone, the Upland Agricultural Zone, and the Forest-recreational Zone.

The Foothill Zone is comprised of rather shallow, somewhat rocky, red-colored upland soils that are presently being utilized largely for range grazing. The area is typified by a generous cover of oaks and grasses or spotty stands of dense chaparral. This zone occupies an elevation band beginning on the valley floor on the west, running east to about the 1,800-foot contour.

The Upland Agricultural Zone, comprises a broad belt that runs in a northwesterly direction across the watershed extending from the Cool-Georgetown area on the north to the Placerville-Camino area on the south. Soils in this zone are characteristically deep, reddish-brown in color, fertile, and quite permeable. Some scattered surface and profile rock can be observed in some areas. Native vegetation varies

from oaks and grasses at lower elevations to commercially important mixed coniferous timber stands at higher elevations. As evidenced by the large acreages of pears and apples planted in this zone, the area is highly suited for deciduous orchards.

The third major soil zone, the Forest-recreational Zone, comprises the major acreage of the watershed. This zone is typified by large areas of rough, broken and stony land normally found in the higher elevations of the Sierra Nevada Range. Many of the soils in this zone, though they possess physical properties normally associated with agricultural lands, were classified as being best suited to remain in some sort of forest management program due to climatic limitations.

Climate

The American River Hydrographic Unit experiences a wide variety of climates. The summers are warm and dry and the winters cool and wet. There is some thunderstorm activity at the higher elevations during the summer, but the total precipitation from these storms is negligible. The unequal seasonal precipitation is illustrated by the fact that on the average 10 percent of the annual precipitation occurs in one day, 25 percent occurs in 12 days, and 50 percent occurs in 60 days, during the winter. The summers by contrast receive less than one percent of the annual precipitation.

The importance of snowfall in the unit is great. Melting snow contributes an estimated 40 percent of the annual runoff of the American River. By April 1, with the average snow line located near the 5,000-foot elevation the

snowpack covers 55 percent of the watershed. At the 5,000-foot elevations 35 percent of the annual precipitation occurs as snow while at 7,000 feet 75 percent occurs as snow.

The elevation of greatest total precipitation for the American River Basin is near 5,500 feet which is the elevation where orographic lifting of moist tropical marine air masses is most active. To the east in the higher elevations, precipitation totals diminish.

Table 2 shows the mean annual precipitation at selected stations within and adjacent to the American River Hydrographic Unit.

Temperatures in the hydrographic unit are influenced by prevailing air masses, elevation, and drainage of cold dense air from higher elevations into the valley. When dry air enters and occupies the American River Watershed from the east, the extremes of both summer heat and winter cold are more pronounced. Summer temperatures will at times exceed 100 degrees at lower elevations, while very low winter temperatures are often experienced at higher elevations.

Table 3 presents data on temperature and length of frost free period for six representative weather stations. The temperatures presented are the arithmetic means of the daily maximum and minimum temperatures and the extreme maximum and minimum temperatures for the indicated period of record. The length of the frost free period represents the average period, in days, between the last day in spring and the first day in fall when the minimum daily temperature is above 32 degrees Fahrenheit.

Water Resources

Streamflow in the American River Basin is influenced by snowmelt which delays spring runoff beyond the main precipitation period and into the late spring and summer months.

Runoff records of 10 years or longer are available for 23 stream gaging stations. The station, American River at Fair Oaks, has the longest period of record 57 years. It is situated on the main stream about 10 miles below Folsom Dam in the Sacramento Valley Floor Hydrographic Unit.

Pertinent streamflow records of the American River Basin are summarized in Tables 4 and 5, to illustrate runoff characteristics and the individual station period of record.

In 1960, during which most of the diversions in this unit were measured, runoff at the Fair Oaks gage was 65 percent of the average annual discharge for 1904-1961, eliminating the effect of Folsom Reservoir operation since 1956. During the May-October period, runoff recorded was approximately 47 percent of the long-term average for this six-month period.

Local Agencies Concerned with Water Development

Local agencies that are concerned with water development in the American River Hydrographic Unit include El Dorado Irrigation District, public utility districts, and several miscellaneous water service agencies.

The El Dorado Irrigation District is situated adjacent to the unit's southern boundary and serves irrigation, municipal, and domestic users. A brief discussion concerning the district and its surface water diversions is

contained in Appendix D. Other water agencies serving agricultural interests and other users are Georgetown Divide Public Utility District, Coloma-Lotus Ranch Ditch (an unincorporated mutual water company), and Pacific Gas and Electric Company.

A portion of the water supplied to meet urban requirements in the unit is delivered by the municipal water department of Placerville, and public utility districts near Foresthill, Georgetown, and Pollock Pines. Along the northwest boundary of the unit, urban areas are served by the Pacific Gas and Electric Company either directly or through other water service agencies. Other urban service is received from commercial water companies, mutual water companies, county water districts, and other miscellaneous water service agencies.

Agencies presently active in water development in the American River Hydrographic Unit are the Georgetown Divide Public Utility District, the Placer County Water Agency, and the Sacramento Municipal Utility District. The Georgetown Divide Public Utility District is developing storage and improving conduit conditions in the Pilot Creek area of the Middle Fork American River. The Placer County Water Agency is developing the Upper American River Basin waters for power and for use in western Placer County in the Sacramento Valley Floor Hydrographic Unit. One of the initial units under construction is French Meadows Dam and Reservoir on the Middle Fork American River. The Sacramento Municipal Utility District is developing the waters of the Rubicon River and

South Fork American River for the production of power.

Developments by the above-mentioned districts are discussed in detail in Appendix E.

CHAPTER II. WATER USE

Present water requirements in the American River Hydrographic Unit are met almost entirely by diversion of surface runoff. The water use survey conducted for this report, results of which are discussed herein, was limited to the investigation of those individual uses of surface water exceeding 10 acre-feet per year. The survey, encompassing diversion of water for all purposes, developed information concerning: (1) location of the surface water diversion point, (2) description of the diversion structure and system, (3) use of the diverted water, (4) amount of water diverted, and (5) the apparent water right under which the diversion was made.

Present Water Use

Quantities of water diverted from selected surface sources during 1960 were measured. These measured quantities do not necessarily represent average diversion amounts, since in any single year the quantity diverted will be influenced by precipitation during the growing season and the available streamflow. As was shown in Tables 2 and 4, the precipitation runoff in 1960 was well below normal. Considerations other than the available water supply, such as economic factors, may also affect the relation of any diversion record to typical operating conditions. The diversion quantities reported in Table 7 represent the actual amounts of water taken from the respective sources, and therefore include the recoverable and irrecoverable losses incidental to the primary use.

The location of water wells and the measurement of their yields were not covered in this investigation since it was determined that their importance was minor in the unit. However, areas irrigated by ground water as well as surface water, were determined in the land use survey described in Chapter III.

A large part of the urban water use in the unit is supplied by Pacific Gas and Electric Company. Urban areas receiving water from Pacific Gas and Electric Company by way of the Boardman Canal System are listed below:

<u>Area</u>	<u>Delivery made to</u>
Alta	Individual water users
Auburn ¹	Individual water users
	Morgan Tract Water Users Association
	Oak Ridge Mutual Water Company
Colfax	Alpine Meadows Property Owners Association, Inc.
	McGee Irrigation Company ²
	Riverview Estate Water Supply
Gold Run	Individual water users
Shady Glenn	Individual water users

Other urban areas in the hydrographic unit receive water from many small service agencies. Some of these provide only partial service for recreational urban use, and were not included in this investigation. Major water service agencies other than Pacific Gas and Electric Company are listed below:

¹ Includes urban areas in the vicinity of Auburn and between Auburn and Colfax along U. S. Highway 40.

² Succeeded by Applegate Clipper Gap County Water District in 1962.

<u>Location</u>	<u>Supplier</u>	<u>Source</u>

Water Rights

Water rights are an important consideration in the determination of availability of waters which are surplus to the present and future needs of an area wherein the waters originate. Data were obtained with respect to apparent water rights of the surface water diversions described in Table 6. These rights may be based on appropriative or riparian status and may have been defined by adjudication. Some water use in the American River Hydrographic Unit is based on appropriative

rights established prior to 1914. A brief explanation of Water Rights is included in Appendix C of this report.

As of October 1963 a total of 601 currently valid applications had been made in the unit under the provisions of the Water Commission Act of 1914. Permits or licenses had been granted for 556 of these applications, 12 were pending with the State Water Rights Board, and 33 were incomplete as of that date. These applications are tabulated in Appendix C, Table C-1.

Surface Water Diversions

During the survey all diversions of surface water in excess of 10 acre-feet per year, which could be field located, were plotted on aerial photographs having a scale of about 1:20,000. All diversions in use in 1960, as well as those which had been used within the preceding five years, were included. The date of last use, if known, was recorded for discontinued diversions. Direct diversions, as well as diversions to storage, were located. All reservoirs which had surface areas of about three acres or more were mapped. Considering an average annual evaporation rate of 40 inches in the unit, reservoirs of 3 acres surface area would have an annual evaporation of about 10 acre-feet. Reservoirs located along and operated in conjunction with canals and ditches were shown on the land and water use maps, but were not considered as separate systems and were not assigned location numbers. Similarly, minor water supplies from small intermittent streams intercepted by canal systems are not classed as separate diversions.

In some cases water users have made efficient use of water supply by rediverting field runoff or spill collected from their own upstream diversion systems. In this investigation such points of rediversion were neither located on the maps nor assigned numbers. However, if return flow from another water user's operation was rediverted or if there was doubt as to the origin of the water, the diversion was delineated and assigned a number. Diversion systems of water companies or groups of water users were considered as single units, and individual customer distribution points were not shown on the maps.

There were 249 surface water diversions located in the unit in 1960. These diversions were classified by primary use as follows:

<u>Primary use</u>	<u>Number of diversions</u>
Irrigation	143
Municipal	7
Industrial (lumber mills)	6
Mining	9
Power	16
Domestic	19
Stockwatering	6
Recreational	10
Other	<u>33</u>
Total diversions located	249

Points of diversion and main canals or pipelines are delineated on the 28 sheets of Plate 2 entitled, "Land and Water Use." The diversions are listed in Table 6 entitled, "Descriptions of Surface Water Diversions in American River Hydrographic Unit."

Spill from
South Canal

Towle Canal
Diversion
Structure

Numbering System for Surface Water Diversions

Surface water diversions are numbered to indicate their location by township, range, and section. For this report each section was subdivided into 40-acre plots, and the diversions are numbered within each of these 40-acre plots according to the order in which they were located. For example, D11N/9E-14Q1, which is shown on Sheet 18 of Plate 2 as "14Q1," was the first diversion located in the SW $\frac{1}{4}$ of the SE $\frac{1}{4}$ of Section 14 in Township 11 North, Range 9 East, Mount Diablo Base and Meridian.

Descriptions of Surface Water Diversions

Descriptions, histories, and other information relating to surface water diversions were obtained by field inspection, by interview with water users or their representatives, and by reference to prior reports and official records. This information is contained in Table 6. Data in the table are arranged by diversion number within each subunit. Location of subunit boundaries is shown on Plate 1.

The purpose of each diversion, the quantity of water diverted during 1960, the extent of use such as number of acres irrigated, and method of application of water are included in Table 6. If the purpose listed is not the usual use for that diversion, notation is made in the remarks. The extent of domestic use is specified only when five or more connections are served. Stockwatering of less than 10 head of livestock is considered to be a domestic use. The extent of irrigation is based on the land use survey described in Chapter III.

The type of water right under which the respective diversions are considered to be made is indicated in Table 6 as the "apparent water right." The determination of this item is based upon the best information available from the owner, files of the State Water Rights Board, official records, and other sources. The amount of the right, if established and known, and a reference to the source of data are also included. Although this information is believed to be accurate, it is emphasized that it is not based on sworn claims or testimony and should in no way be construed to represent a conclusive determination of water rights. In this report, references to the "miner's inch" are quotes from the appropriative filings and no attempt was made to evaluate these in cubic feet per second.

Diversions for which water rights have been adjudicated are listed in Table 6 as "adjudicated." Those based on appropriative rights are listed as "appropriative." Those which have been neither adjudicated nor based on appropriations but for which the area of use is apparently riparian to the streams or which the owner claims to be riparian are listed as "riparian." The areas of use of some diversions listed as adjudicated or appropriative may be riparian to water sources, but no attempt was made in this investigation to make such determinations.

In the case of an adjudicated right, the amount of the decreed right is tabulated. For an appropriative right the amount tabulated is that found in the filing, application, or latest permit or license which may have been issued in

connection with the application. The reference given for an appropriation initiated after the effective date of the Water Commission Act of 1914 is the number of the application on file with the State Water Rights Board. For appropriations prior to 1914, the reference, if known, is the book and page number of the official county record in which the filing is recorded. Such filings were made in accordance with Sections 1410 and 1422 of the Civil Code as enacted in 1872, which preserved the priority of a diligent appropriator from the time of filing and enabled him to prevail over a concurrent non-statutory appropriator.

Records of Surface Water Diversions

Records of surface water diversions in the unit were obtained from the operating agency when possible. When necessary, continuous or periodic measurements of surface water diversions were made by the Department of Water Resources wherever it was feasible to measure the flows. Most of the diversions for nonagricultural uses and some of those used for agriculture were operated throughout the year. Substantially all diversion measurements were started by April 1960, prior to the commencement of intensive irrigation, and continued through the irrigation season. Some of the diversions were not located until late in the survey, and no measurements or estimates of these were attempted. When feasible, the measurement of a diversion was made at a location above the area of first use and as close to the diversion intake as possible but below any regulatory spill.

Recorder on
Diamond Ditch

Diversion Dam

Diverted quantities were determined by measurement of open channel flow and rating of pumps. Periodic current meter measurement of open channel flows were made during the diversion season to obtain channel ratings. The water surface stage was recorded either by weekly observations of a staff gage or with a continuous water stage recorder, from which quantities of flow were calculated. Existing weirs were used wherever available. Pumps were rated and quantities of flow calculated from operation or power records. These observations were supplemented by interview of water users to obtain additional staff gage readings and to obtain data on possible abrupt changes in operation between readings.

Results of the diversion measurements are summarized in Table 7. When the recorded data were considered sufficiently reliable, monthly diversion quantities are shown in acre-feet. When the diversion for a given period is known to have been zero, it is so indicated. However, when the recorded data were incomplete or missing, the following notations are used: "---*---" to indicate that the data were sufficient to estimate the total quantity only; "---NR---" to indicate the period during which no recorded data were available.

Index to Surface Water Diversions

For convenience of the reader, an alphabetical index of diversion owners and diversion names, along with the sub-unit location of each diversion, references to the sheet number of Plate 2, and page numbers of the text or appendixes on which data concerning each appear, is shown in Table 9.

Imports and Exports

Imports

Surface water is imported to the unit at five points from adjacent watersheds, for use in the American River Basin. They are: Boardman and Bear River Canals from the Yuba-Bear Rivers Watershed; Echo Lake Conduit from the Truckee River Watershed; and Sly Park-Camino Conduit and Diamond Ditch from the Cosummes River Watershed.

The Boardman and Bear River Canal systems of the Pacific Gas and Electric Company deliver a portion of their supply through laterals to the American River Watershed for irrigation, domestic, and municipal uses, with the excess released to Folsom Reservoir on the American River. The areas served by these imports extend along the northern boundary of the hydrographic unit from the Dutch Flat area to Roseville. The primary area irrigated is south and southwest of Auburn. The principal municipal service area is that portion of the City of Auburn within the hydrographic unit.

The Echo Lake Conduit, part of the Pacific Gas and Electric Company system, imports water during the summer and fall months of low flow to the upper reaches of the South Fork American River for power generation purposes.

The Sly Park-Camino Conduit delivers water from the Sly Park Unit of the Central Valley Project located in the Cosummes River Watershed to the El Dorado Ditch near Camino. The El Dorado Irrigation District delivers the water for irrigation within the district.

The Diamond Ditch imports a minor quantity of water from the Cosumnes River Watershed. This water is delivered to local water users southwest of Placerville, mainly for irrigation, by El Dorado Irrigation District.

Exports

Five diversions in the American River Hydrographic Unit export water from the unit for use in the Yuba-Bear Rivers Watershed and the Sacramento Valley Floor.

Along the northern boundary of the unit, Lake Valley Canal, Pulp Mill Canal, and Towle Canal, all owned by Pacific Gas and Electric Company, divert from the North Fork American River area. Lake Valley Canal diverts from the North Fork of North Fork American River to supplement the Drum Canal, the Pulp Mill and Towle Canals divert from Canyon Creek to supplement the Boardman Canal.

The other two export diversions, the North Fork Ditch and the Natomas Ditch, formerly diverted from the North Fork and South Fork of the American River, respectively. With the completion of Folsom Dam, and the filling of the reservoir, these ditches were inundated. Present water deliveries to the entities formerly served by these ditches are now made from a pumping station near the face of the dam in the Sacramento Valley Floor Hydrographic Unit.

For records of measured quantities of water exported to other hydrographic units and imported to the unit, see Table 8. Location of points of import and export are designated on Plate 2.

Consumptive Use

In the American River Hydrographic Unit, the largest quantity of water diverted from surface streams is used to produce hydroelectric power, but the largest consumptive use of water is by irrigated agriculture. Consumptive use of water is defined as the quantity of water consumed by vegetative growth in transpiration and building of plant tissue, and by water evaporated from foliage, adjacent soil, and water surface; and also it includes water similarly consumed and evaporated by urban and nonvegetative types of land use. Although evaporation from storage reservoirs and canal systems may be significant, sufficient data were not available to estimate these losses.

Based on the unit consumptive use values in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," consumptive use of applied water during 1960 is estimated to have been 16,700 acre-feet for irrigated agriculture. In addition, approximately 2,200 acre-feet were used for domestic and municipal purposes, and 200 acre-feet for industrial purposes. The consumptive use of water for mining purposes, mainly evaporation from canal surfaces, is considered negligible. These unit values of consumptive use of applied water from Bulletin No. 2 for the American River Unit are: pasture 2.1, orchard 1.3, hay and grain 0.6, and miscellaneous field crops 0.9 acre-feet per acre.

The total water diversion measured during 1960 was 139,440 acre-feet, as detailed in Table 7. Of this 49,818 acre-feet were diverted for irrigation, 86,118 acre-feet for power

generation and 1,659 acre-feet for mining. Seasonal diversion rates of individual diversion systems for irrigation varied from less than 0.9 to over 24.5 acre-feet per acre.

DESCRIPTIONS OF SURFACE WATER DIVERSIONS IN
AMERICAN RIVER HYDROGRAPHIC UNIT

Diversion location and plate 2 sheet number	Diversion name and/or owner	Source	Water use in 1960			Apparent water right		Indicated date of appropriation or first use	Description of diversion system	Remarks	
			Purpose	Extent and method of use	Amount diverted in acre-feet	Type	Amount				Reference
COLOMA SUBUNIT											
M O B & M D10N/11E-21L (Sheet 24)	W. R. A. Wygersma	Tributary to South Fork American River	Irrig.	4 acres by sprinkler	Not meas.	Approp.	--	--	Prior 1914	Storage and pump; earth dam 15 feet high, 350 feet long, with 3 hp electric motor.	Former owner: O. Fitch.
D10N/11E-3J1 (Sheet 24)	W. C. Cumming	White Rock Creek	Irrig. Reer.	10 acres by flooding Swimming and fishing	Not meas.	Approp.	0.5 cfs	A-12240 ^a	About 1870	Storage and pump; earth dam 20 feet high, 400 feet long, with 10 hp electric motor and 0.1 mile of 4-inch pipe. Storage capacity: 25 af	Former owners: F. W. McCuen, W. J. Cumming.
D10N/12E-4J1 (Sheet 25)	Katherine C. Lareen and Sons	Brush Canyon	Irrig. Domestic	153 acres by sprinkler* (b)	141	Approp.	0.5 cfs	A-6410 ^a	About 1860	Gravity; 3,000 feet of earth ditch and 5,500 feet of 4- and 6-inch pipe.	Area irrigated received supplemental water purchased from El Dorado Irrigation District.
D11N/9E-3R1 (Sheet 18)	Byron and Francis Bacchi	Greenwood Creek	Irrig.	17 acres by sprinkler	32	Riparian	--	--	1934	Pump; 15 hp electric motor with 0.3 mile of 3-inch pipe.	
D11N/9E-6A1 (Sheet 18)	C. A. Steves	Tributary to Hastings Creek	Irrig.	13 acres by flooding	Not meas.	(c)	--	--	1955	Storage and pump; earth dam 17 feet high, 150 feet long, with 10 hp electric motor and 80 feet of 4-inch pipe.	
D11N/9E-7B1 (Sheet 18)	B. Blinehl	Tributary to Blue Tent Creek	Irrig.	4 acres by sprinkler	Not meas.	(c)	--	--	1949	Storage and pump; 3 small reservoirs with earth dams approximately 10 feet high, 200 feet long, with a 7.5 hp electric motor and 0.2 mile of 2- and 3-inch pipe.	
D11N/9E-7R1 (Sheet 18)	K. W. and Melba Trowbridge	Norton Ravine	Stock Reer. Fire Prot.	60 head Fishing	Not meas.	Approp.	15 af	A-13766 ^a	About 1938	Storage; earth dam 25 feet high, 200 feet long. Storage capacity: 15 af	
D11N/9E-8F1 (Sheet 18)	Richard M. Miller	Norton Ravine	Stock.	--	Not meas.	Approp.	22 af	A-12124 ^a	1947	Storage; earth dam 28 feet high, 266 feet long. Storage capacity: 42 af	
D11N/9E-12C1 (Sheet 18)	Byron and Francis Bacchi	Brush Creek	Irrig. Stock.	11 acres by sprinkler* 1,000 head	Not meas.	(c)	--	--	1942	Storage and gravity; earth dam 29 feet high, 300 feet long, with 0.5 mile 4-inch pipe. Storage capacity: 29 af	Normally irrigated additional 2 acres. Area idle in 1960.
D11N/9E-12F1 (Sheet 18)	Byron and Francis Bacchi	Brush Creek	Irrig.	9 acres by sprinkler	Not meas.	Riparian	--	--	1934	Pump; 10 hp electric motor with 600 feet of 3-inch pipe.	

* See remarks.

COLOMA SUBUNIT (Continued)										
M. D. S. & M. DILN/9E-16Q1 (Sheet 18)	Tributary to South Fork American River	Irrig. Stock.	5 acres by sprinkler* 60 head	Not meas.	Approp.*	0.37 cfs 63 af	A-15804 ^a	About 1954	Storage and gravity; earth dam 23 feet high, 300 feet long, with 20 feet of 4-inch pipe to pipeline from DILN/9E-16Q2. Storage capacity: (*)	Acreage reported was irrigated jointly with DILN/9E-16Q2, DILN/9E-21A1 and DILN/9E-21H1. Water right amount apply to DILN/9E-21H1 for direct diversion and to DILN/9E-16Q1, DILN/9E-16Q2 and DILN/9E-21A1 for storage. Aggregate storage capacity: 63 af
DILN/9E-16Q2 (Sheet 18)	Tributary to South Fork American River	(*)	(*)	Not meas.	(*)	(*)	(*)	About 1954	Storage and gravity; earth dam 23 feet high, 200 feet long, with 0.2 mile of 4-inch pipe. Storage capacity: (*)	Water use and water right data reported under DILN/9E-16Q1.
DILN/9E-21A1 (Sheet 18)	Tributary to South Fork American River	(*)	(*)	Not meas.	(*)	(*)	(*)	About 1954	Storage and gravity; earth dam 23 feet high, 300 feet long. Storage capacity: (*)	Water use and water right data reported under DILN/9E-16Q1.
DILN/9E-21H1 (Sheet 18)	Burnt Shanty Creek	(*)	(*)	Not meas.	(c)	—	—	About 1870	Gravity; earth dam 5 feet high, 50 feet long, with 0.8 mile of earth ditch to storage in DILN/9E-16Q1.	Former owner: G. Baasly. Water use reported under DILN/9E-16Q1.
DILN/9E-23H1 (Sheet 18)	Jacobs Creek Reservoir L. D. Stodick	Irrig. Stock. Recr.	400 head Fishing and hunting	Not meas.	Approp.	636 af	A-12131 ^a	1947	Storage and gravity; earth dam 48 feet high, 350 feet long, with 2,680 feet of 4-, 6- and 8-inch pipe.* Storage capacity: 587 af	Previously irrigated 90 acres. Area was idle in 1960. Storage is released to natural channel below reservoir for conveyance to pipeline at DILN/9E-16Q1.
DILN/9E-27H1 (Sheet 18)	Tributary to South Fork American River	Stock.	34 head	Not meas.	(c)	—	—	1958	Storage; earth dam 35 feet high, 300 feet long.	
DILN/10E-6L1 (Sheet 19)	Indian Creek	Domestic Stock.	(b) 200 head	Not meas.	Approp.	0.05 cfs	A-4868 ^a	1925	Gravity; 1.9 miles of 2-, 2.5-, 3- and 4-inch pipe.	
DILN/10E-14J1 (Sheet 19)	Kelasey Canyon	Irrig. Domestic	9 acres by sprinkler (b)	Not meas.	Riparian	—	—	Prior 1952	Pump; 5 hp electric motor with a 3-inch pipeline.	Former owner: George Neilson.
DILN/10E-16M1 (Sheet 19)	Mansfield Ditch Melvin and Frank Gallagher	Irrig. Stock.	10 acres by flooding* 40 head	Not meas.	Approp.	—	—	About 1860	Gravity; earth dam with 1.0 mile of earth ditch.	Former owner: Mansfield. Acreage reported was irrigated jointly with DILN/10E-17Q1. Normally irrigated additional 2 acres.
DILN/10E-17Q1 (Sheet 19)	South Fork American River	Irrig.	(*)	108*	Riparian	—	—	About 1919	Pump; 10 hp electric motor with 0.2 mile of earth ditch	Amount diverted irrigated jointly with DILN/10E-16M1.

* See remarks.

H D B & M D11M/10E-18N1 (Sheet 19)	Robert C. and Faye E. Spence	South Fork American River	Irrig. Domestic	(*) (b)	Not meas.	Approp.*	0.014 cfs	About 1955	Pump; 5 hp electric motor with 0.2 mile of 2.5-inch pipe.	Former owners: Harry and Violet Heasdale. Previously irrigated 6 acres. Area was idle in 1960. Water right filed in name of Harry and Violet Heasdale.
D11M/10E-26L1 (Sheet 19)	Coloma-Lotus Ranch State of California Division of Beaches and Parks G. Barber A. Herzog L. D. Stedick	South Fork American River	Irrig. Stock.	181 acres by flooding and sprinkler* 750 head	3,490	Approp.	--	About 1858	Gravity; concrete dam 4 feet high, 300 feet long, with 12.0 miles of earth ditch.	Former owners: El Dorado Tunnel Mining and Ditch Company; Will Stearns; Mrs. M. Mahler; Mrs. J. L. Norris; Husmeesen Estate; Bascay; M. White; G. W. Hasey; E. K. Weller; E. Weller; Faling; O. W. Osburn; D. Haggart; G. Wagner; Joe Blundie; M. W. Valentine and H. Mahler. Previously irrigated additional 44 acres. Area idla in 1960.
D11M/10E-28K1 (Sheet 19)	Charles W. and Lorraine Herrill	Tributary to Indian Creek	Irrig. Stock.	5 acres by sprinkler*	Not meas.	Approp.	0.016 cfs	1954	Pump; 3 hp electric motor with aluminum pipeline.	Previously irrigated a 20 acre orchard.
D11M/10E-29C1 (Sheet 19)	Norman Winje	Chuck Ravine	Irrig. Recr.	7 acres by furrow Fishing	Not meas.	Approp.*	4 af	1948	Storage and pump; earth dam 14 feet high, 258 feet long, with 5 hp electric motor and 250 feet of 4-inch pipe. Storage capacity: 12 af	Water right filed in name of Sam Winje.
D11M/10E-29Q1 (Sheet 19)	Malcolm Veerkamp	Granite Creek	Irrig. Stock. Recr.	40 acres by flooding 60 head Fishing	73	(c)	--	About 1931	Storage and gravity; earth dam 20 feet high, 300 feet long, with 0.2 mile of earth ditch.	Former owner: L. W. Veerkamp.
D11M/10E-33A1 (Sheet 19)	George H. and Isabelle D. Volz	Tributary to Indian Creek	Irrig. Stock. Recr.	7 acres by sprinkler 15 head Fishing	Not meas.	Approp.	11 af	About 1943	Storage and gravity; earth dam 15 feet high, 325 feet long, with 10 hp electric motor and 0.2 mile of 4-inch pipe. Storage capacity: 23 af	Former owner: A. H. Hamilton.
D11M/10E-33A2 (Sheet 19)	Leo A. Akin	Indian Creek	Irrig. Stock. Recr.	39 acres by furrow 12 head Fishing	Not meas.	Approp.	.0062 cfs	About 1933	Storage and gravity; earth dam 20 feet high, 200 feet long, with 0.1 mile of earth ditch and 3,000 feet pipeline. Storage capacity: 23 af	
D11M/10E-34E1 (Sheet 19)	George H. and Isabelle D. Volz	Tributary to Indian Creek	Irrig. Domestic Stock. Recr.	24 acres by sprinkler (b) 15 head Fishing	Not meas.	Approp.	24 af	About 1940	Storage and pump; earth dam 15 feet high, 100 feet long, with 7.5 hp electric motor and short pipeline. Storage capacity: 24 af	Former owner: A. H. Hamilton.

* See Remarks.

COLOMA SUBUNIT (Continued)											
M D E & M D11N/11E-16Q1 (Sheet 19)	Finnon Reservoir State of California Department of Fish and Game	Jaybird Creek *	Reer.	Swimming and fishing	Not meas.	Approp.	—	—	1905	Storage; earth dam 50 feet high, 830 feet long. Storage capacity: 400 af	Former owners: American River Electric Company, Western States Gas & Electric Company, Pacific Gas & Electric Company and Mokito District Mutual Water Company. Main source of supply is from Slab Creek via DL2N/12E-28F1 (Summer field ditch).
D11N/11E-32M1 (Sheet 19)	Lawrence T. and Vera Moore	Spring tributary to White Rock Creek	Irrig. Domestic	6 acres by sprinkler (b)	Not meas.	Approp.	.011 cfs	A-11303 ^a	Prior 1946	Pump; electric motor with 500 feet of 1-inch pipe.	Former owner: Roy Radon. Acreage irrigated received supplemental supply from El Dorado Irrigation District.
D11N/11E-33B1 (Sheet 19)	George H. and Isabelle O. Volz	Tributary to South Fork American River	Irrig. Stock Reer.	46 acres by sprinkler ^a 15 head Fishing	Not meas.	Approp.	44 af	A-13971 ^a	About 1946	Storage and pump; earth dam 25 feet high, 500 feet long, with 5 hp electric motor. Storage capacity: 45 af	Acreage reported was irrigated jointly with D11N/11E-33B2, D11N/11E-33U1 and supplemental water purchased from El Dorado Irrigation District.
D11N/11E-33B2 (Sheet 19)	George H. and Isabelle O. Volz	Tributary to South Fork American River	Irrig. Stock. Reer.	10 head Fishing	Not meas.	Approp.	55 af	A-13971 ^a	About 1954	Storage and pump; earth dam 25 feet high, 300 feet long, with 10 hp electric motor. Storage capacity: 30 af	Amount diverted irrigated jointly with D11N/11E-33B1, D11N/11E-33U1 and supplemental water purchased from El Dorado Irrigation District.
D11N/11E-34U1 (Sheet 19)	George H. and Isabelle D. Volz	Spring tributary to Indian Creek	Irrig. Stock.	8 acres by eprinkler* 15 head	Not meas.	Riparian	—	—	About 1957	Gravity; drain system picks up flow from springs and purchased irrigation water.	Amount diverted also irrigated jointly with D11N/11E-33B1, D11N/11E-33B2 and supplemental water purchased from El Dorado Irrigation District.
D11N/11E-34Q1 (Sheet 19)	J. E. Hassler Estate	South Canyon	Irrig.	21 acres by furrow	Not meas.	Approp.	—	—	Prior 1914	Gravity; earth and gravel dam with 150 feet of wood flume and 0.3 mlie of earth ditch.	Former owner: W. I. Hartwick.
D11N/11E-34M1 (Sheet 19)	J. E. Hassler Estate	South Canyon	Irrig.	2 acres by furrow	Not meas.	Approp.	—	—	Prior 1914	Gravity; 70 feet of 6-inch pipe and 0.3 mlie of earth ditch.	Former owner: John Cleese.
D11N/11E-34K1 (Sheet 19)	Lucy M. Brunius	Spring tributary to South Canyon	Irrig.	26 acres by sprinkler	Not meas.	Riparian	—	—	Prior 1900	Pump; 5 hp electric motor with a short pipeline.	Former owner: J. E. Hassler.
D11N/11E-35K1 (Sheet 19)	A. C. and Juanita Winkelman	North Canyon Creek	Irrig.	29 acres by sprinkler	Not meas.	Riparian	—	—	Prior 1920	Pump; 10 hp electric motor with 1,700 feet 3- and 6-inch pipe.	Former owner: Adam Haseler.
D11N/11E-35F1 (Sheet 19)	J. E. Hassler Estate	South Canyon	Irrig.	14 acres by furrow	Not meas.	Approp.	—	—	About 1890	Gravity; rock and gravel dam with 1.1 miles of earth ditch.	Former owner: J. E. Hassler.
D11N/11E-35K1 (Sheet 19)	A. C. and Juanita Winkelman	South Canyon Creek	Inouet.	Lumber mill and log pond	Not meas.	(c)	—	—	About 1946	Storage; earth dam 15 feet high, 200 feet long.	Former owner: Adam Haseler.
D11N/11E-35K1 (Sheet 19)	J. A. Hassler A. C. and Juanita Winkelman	Coon Gulch	Irrig. Domestic	17 acres by flooding and sprinkler (b)	417	Approp.	0.75 cfs	A-9463 ^a	Prior 1900	Gravity; earth and rock fill dam with 0.6 mlie of earth ditch.	Former owner: Adam Haseler.

		Purpose	Extent and method of use	Amount diverted in acre-feet	Type	Amount	Reference			
COLOMA SUBUNIT (Continued)										
D11W/11E-35Q1 (Sheet 19)	South Canyon Creek	Indus. Fire Stock. Recr.	Lumber mill — 100 head Swimming and fishing	Not meas.	(c)	—	—	About 1950	Storage; earth dam 8 feet high, 120 feet long.	
D11W/11E-36K1 (Sheet 19)	North Canyon Creek	Irrig. Domestic	54 acres by sprinkler* 30 persons	Not meas.	Approp.	—	Book of Water Rights Page 262d	About 1860	Storage and gravity; earth dam 26 feet high, 300 feet long, with 1.3 miles of 4-, 6-, 8-, and 10-inch pipe.	Former owners: Johnson; John Gleese; Halifax. Previously irrigated an additional 19 acres. Area was idle in 1960.
D11W/12E-19N1 (Sheet 20)	South Fork American River	Power	5,600 kw	—	Approp.	—	—	1903	Gravity; timber crib dam 51 feet high, 170 feet long, with 7.3 miles of canal and flume.	Former owners: American River Electric Company; Western States Electric Company.
D11W/12E-25L1 (Sheet 20)	Deadman Spring	(*)	(*)	Not meas.	Approp.*	0.2 cfs	A-17357 ^a	1950	Pump; 15 hp electric motor with 100 feet of 6-inch and 1,200 feet of 4-inch pipe.	Water right also listed in name of Placerville Lumber Company and is leased by Pollock Pines Public Utility District. Amount diverted is pumped into El Dorado Main Canal as partial repayment for water purchased from El Dorado Irrigation District.
D11W/12E-31H1 (Sheet 20)	Brush Canyon	Irrig. Domestic	63 acres by sprinkler (b)	476	Approp.	1.25 cfs	A-3405 ^a	1923	Gravity; 2.0 miles of earth ditch and 0.6 mile of 6-inch pipe.	
D11W/12E-35H1 (Sheet 20)	Tributary to Iowa Canyon	Irrig. Domestic	8 acres by furrow* (b)	Not meas.	Approp.	—	—	Prior 1900	Gravity; 0.3 mile of earth ditch.	Area irrigated received supplemental water purchased from El Dorado Irrigation District.
D12W/9E-13D1 (Sheet 11)	Tributary to Penobscot Creek	Recr.	Fishing	Not meas.	(c)	—	—	1953	Storage; earth dam 10 feet high, 100 feet long.	
D12W/9E-14A1 (Sheet 11)	Penobscot Creek	Irrig. Stock. Recr.	15 acres by sprinkler 475 head Fishing	17	(c)	—	—	1952	Storage and pump; earth dam 30 feet high, 250 feet long, with 5 hp electric motor and 0.3 mile of 5-inch pipe.	
D12W/9E-16A1 (Sheet 11)	Black Rock Creek	Irrig.	30 acres by furrow	91	Approp.* Approp.	145 af .090 cfs .15 cfs	A-13521 ^a A-12999 ^a	1946 1949	Storage and gravity; earth dam 10 feet high, 250 feet long, with 0.6 mile of earth ditch.	Water Right Application No. 13521 assigned to Bernice and Ralph Bowen 4/16/62 and Application No. 12999 partially assigned to Bernice Bowen 11/9/60.
D12W/9E-16K1 (Sheet 11)	Tributary to Black Rock Creek	Irrig. Stock.	26 acres by flooding 50 head	63	Approp.	40 af	A-13520 ^a	1947	Storage and gravity; earth dam 25 feet high, 300 feet long, with 0.25 mile of earth ditch. Storage capacity: 50 af	

* See remarks.

M. D. B. & H. DLIN/13E-35K1 (Sheet 20)	Floyd Poole	Tributary to South Fork American River	Irrig. Domestic	4 acres by flooding 8 connections	Not meas.	Riparian	--	--	1949	Gravity; 0.4 mile of earth ditch.	
DLIN/14E-36K1 (Sheet 21)	Alder Creek Pipe-line Pacific Gas and Electric Company	Alder Creek	Power	(*)	(*)	Approp.	15.0 cfs	A-6383 ^a	1929	Gravity; masonry dam 10 feet high, 100 feet long, with 0.7 mile of 18-inch pipe to El Dorado Ditch.	Amount diverted supplements DLIN/15E-29K1 (El Dorado Ditch).
DLIN/15E-21K1 (Sheet 21)	Kyburz Incorporated	Tributary to South Fork American River	Domestic	(*)	Not meas.*	Approp.	6.0 cfs	A-1623 ^a	1920	Gravity; concrete dam 3 feet high, 15 feet long with 0.3 mile of 4-inch pipe.	Amount diverted served jointly with DLIN/15E-22K1 and DLIN/15E-22K2.
DLIN/15E-22K1 (Sheet 21)	Kyburz Incorporated	Tributary to South Fork American River	Domestic	100 connections*	Not meas.	Approp.	6.0 cfs	A-1623 ^a	1920	Gravity; concrete dam 10 feet high, 40 feet long, with 0.2 mile of 6-inch pipe.	Use reported as served jointly with DLIN/15E-21K1 and DLIN/15E-22K2. Serves community of Kyburz and vicinity.
DLIN/15E-22K2 (Sheet 21)	Kyburz Incorporated	Tributary to South Fork American River	Domestic	(*)	Not meas.*	Approp.	6.0 cfs	A-1623 ^a	1920	Gravity; concrete dam 3 feet high, 20 feet long, with 500 feet of 4-inch pipe and a 10 hp pump for relief.	Amount diverted served jointly with DLIN/15E-22K1 and DLIN/15E-21K1.
DLIN/15E-23K1 (Sheet 21)	State of California Department of Fish and Game	South Fork American River	Fish Culture	(*)	Not meas.	Approp.	5.0 cfs	A-15705 ^a	1954	Gravity; concrete dam 3 feet high, 25 feet long, with 600 feet of 12-inch pipe to tanks.	Maintains fresh running water in tanks for holding fish prior to stream planting.
DLIN/15E-28K1 (Sheet 21)	Silver Fork Improvement Club	Silver Fork American River	Domestic	40 connections	Not meas.	Approp.	0.1 cfs	A-14518 ^a	1951	Gravity; 0.4 mile of 18-inch pipe and earth ditch.	
DLIN/15E-29K1 (Sheet 21)	El Dorado Ditch Pacific Gas and Electric Company	South Fork American River	Power Irrig. Munic. Domestic	21,000 kw (*) (*) (*)	74,680*	Approp.	86.0 cfs	A-1440 ^a	1876	Storage and gravity; concrete dam 62 feet high, and 385 feet long, with 25 miles of earth ditch, flume, tunnel and pipe to El Dorado Forebay, and 2.9 miles of pipe and penstock to powerhouse.	Former owners: John Kirk and Bishop, El Dorado Water and Deep Gravel Mining Company, Western States Gas and Electric Company. Irrigation, municipal, and domestic use reported under DLIN/12E-18K1 (New Weber Ditch). Amount diverted includes all water diverted by DLIN/12E-25K1 and DLIN/14E-36K1 (Alder Creek Pipeline). **
DLIN/17E-8K1 (Sheet 22)	N. H. Welch	Pyramid Creek	Power	8 kw	Not meas.	Approp.	4.0 cfs	A-6997 ^a	1931	Gravity; rock and concrete dam 4 feet high, 70 feet long, with 200 feet of ditch and flume to penstock.	Water right assigned to William Welden 12/22/60.
DLIN/17E-9K1 (Sheet 22)	Ernest K. Richardson	Tamarack Creek	Domestic	51 connections*	Not meas.	Approp.	0.05 cfs 1.0 af 0.04 cfs	A-11264 ^a A-15623 ^a	1919 1953	Gravity; small rock and concrete dam 3 feet high, 10 feet long, with 0.2 mile of 4- and 6-inch pipe.	Former owner: William Dreher. Serves Pinecrest Camp and vicinity.

* See Remarks.

CHAPTER III. LAND USE

Reported herein are the results of a survey of present land use as related to water use and a brief summary of historical land use. A thorough knowledge of the nature and extent of land and water uses under past and existing conditions is one of the primary requisites in evaluating future water requirements within the hydrographic unit.

Historical Land Use

After the first flush of the gold rush, the attendant need of the mining population for agricultural products resulted in the first planting of vegetable crops near Union Bar and Coloma. The first planting of grain and initial orchard development followed closely. Agriculture gradually expanded until about 1880 and then declined until after World War I, when increased economic demand caused expanded agricultural production with orchards predominating. The depression years of the 1930's forced a decline in agriculture but since 1940 both irrigated agriculture and livestock raising have increased.

Present Land Use

A detailed land use survey in the American River Hydrographic Unit was conducted in 1960 in which the land uses were mapped as they related to water use such as irrigated, dry-farmed, urban, recreational, naturally high water table lands, and native vegetation. Sheets 1 through 28 of Plate 2 detail this land use. Gross land use areas

within each subunit are presented in Table 10. These values include nonwater service areas such as roads, ditches, building and storage areas, and miscellaneous rights-of-way, which occur within the mapped areas.

Methods and Procedures

Field observations of land use were plotted on aerial photographs which had previously been used to locate surface water diversions. An example of land use delineated on an aerial photograph is shown on Page No. 93. After completion of the field mapping, the data was transferred to United States Geological Survey quadrangle maps reproduced at a scale of 1:24,000 to bring the delineated areas to a common scale for accurate determination of acreages. These maps showing the location of all diversions and the irrigated fields, including idle and fallow lands associated with each irrigation diversion, was colored according to the land use categories. These work maps were then used in the preparation of Plate 2.

Another series of these maps was used to compute the land use acreages. Each delineated area on these maps was manually cut out and carefully weighed on an analytical balance. These weights were converted to acreages using ratios determined for each of the individual maps. This method has proven to be an accurate and expedient means of area determination where a large number of small parcels is involved.

Example of Land Use Delineated on Aerial Photograph

Symbols used in this photograph:

- | | | | |
|------|--|--------------|--|
| iP3 | - irrigated mixed pasture | nG6 | - dry-farmed miscellaneous hay and grain |
| iD6 | - irrigated pears | n <u>D13</u> | - dry-farmed walnuts |
| nV | - dry-farmed vineyards | <u>D3</u> | - intercropped with cherries |
| nD10 | - dry-farmed miscellaneous deciduous orchard | NV | - native vegetation |

Irrigated Lands

Irrigated lands, as designated in this report, include all agricultural lands which receive artificially applied water. Acreages are reported in Table 11 by surface water diversion or by ground water, and by subunits showing the crop grown. Irrigated lands were segregated into pasture, orchard, and idle and fallow lands. Pasture was further subdivided into mixed, and native pasture; the latter comprising native pasture lands having a high water table induced by the application of irrigation water. Idle lands are those which were not irrigated in the year of survey but which had been irrigated within the preceding three years. Fallow lands are those cultivated lands which may have been irrigated during the year of survey, but which at the time of survey were only tilled and not planted to a crop.

The lands irrigated by surface water were identified by diversion and by crop irrigated. Lands irrigated by ground water were identified by crop only. On Plate 2 irrigated lands are grouped into three categories: (1) lands which received a full irrigation during the year of survey; (2) lands which received only a partial irrigation because of insufficient water supply; and (3) lands usually irrigated but which were idle or fallow in 1960.

Naturally High Water Table Lands

In addition to the lands which receive applied water as described above, there are lands supporting vegetation utilizing water from a naturally high water table, such as

mountain meadows or lands adjacent to lakes and streams. These are shown in Table 10 as "Meadowlands" and on Plate 2 as "Naturally irrigated meadowlands." If standing water was observed in an area on which tules, cattails, bullrushes, and similar vegetation were growing, the area is shown in Table 10 and on Plate 2 as "Marshlands."

Dry-farmed Lands

Dry-farmed lands are those lands normally planted to a crop but which do not receive artificially applied water. This includes all lands so farmed whether or not a crop is produced in the year of survey. Although lands were mapped as "dry-farmed idle" if uncultivated in the year of survey and "dry-farmed fallow" if tilled but without a crop, they are shown in Table 10 and on Plate 2 as "dry-farmed lands." Lands which had been uncultivated for more than three years and appeared to have reverted to "native vegetation" were so mapped.

It should be noted that the term "dry-farmed" as used herein refers to the farming practice on these lands and not to a lack of soil moisture.

Since noncultivated rangelands are usually indistinguishable from similar lands not used for grazing purposes, both were designated as native vegetation. Water use in both cases is essentially the same and is dependent upon precipitation.

Urban Lands

Urban lands include the total areas of cities, towns, small communities, industrial plots, and military reservations

which are large enough to be delineated. Also included are parks, golf courses, race tracks and cemeteries within or near urban boundaries. The areas shown on Plate 2 and in Table 10 are gross delineations, including streets and vacant lots, and may not have been fully developed at the time of survey. The boundaries of urban communities were delineated to include all lands with a density of one house or more per two acres.

Recreational Lands

Recreational lands were mapped on aerial photographs in the field by four categories: (1) residential, (2) commercial, (3) camp and trailer sites, and (4) parks. Recreational residential lands include permanent and summer home tracts within a primarily recreational area. The estimated density of homes per acre was also indicated. Recreational commercial lands include those containing motels, resorts, hotels, stores, restaurants and similar commercial establishments in primarily recreational areas. Lands mapped in the camp and trailer sites category included areas so used within primarily recreational areas but outside park boundaries. All area within park boundaries was included without regard to specific uses within them. Nearly all of the mountainous and water surface areas are suitable for some use such as hunting, fishing, hiking, picnicking or similar activities. For the purpose of this land use survey, however, consideration was given only to those lands where some fairly intensive development occurs which requires water service.

The recreational lands are combined into one group in Table 10 and on Plate 2. As for urban lands, the recreational areas delineated were not necessarily fully developed.

Native Vegetation

Lands essentially in a native state and not included in any of the above categories were mapped as native vegetation. These lands are generally used for mining, commercial timber production, livestock range, and recreational activities. They totaled 1,164,235 acres or 98 percent of the land within the American River Hydrographic Unit. Included in these areas were some farm buildings and storage areas, water surfaces, scattered residences and other isolated uses covering a few acres or less which were too small to be mapped separately.

a - Includes irrigated truck crops, vineyards and oats. b - Received partial irrigation. c - 26 acres received partial irrigation. d - 89 acres received partial irrigation. e - 21 acres received partial irrigation. f - 1 acre received partial irrigation. g - 50 acres received partial irrigation. 7 acres were intercropped with walnuts. h - 11 acres received partial irrigation. i - 8 acres received partial irrigation. j - 4 acres received partial irrigation. k - 6 acres were intercropped with plums. m - Received supplemental water purchased from El Dorado Irrigation District. n - Received supplemental water purchased from Georgetown Divide Public Utility District. p - Received supplemental water purchased from Pacific Gas and Electric Company. q - Received supplemental supply from a well.													

CHAPTER IV. LAND CLASSIFICATION

Evaluation of future water requirements must be based in large part on classification of lands with regard to their potential for irrigated agricultural and recreational development. The results of such a land classification survey conducted during 1961-62 in the American River Hydrographic Unit are presented in this chapter.

The former Division of Water Resources made a reconnaissance classification of lands of the State including the American River Hydrographic Unit which was reported in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," dated June 1955. In 1950 the Division of Water Resources completed a land classification survey of that portion of the hydrographic unit west of the El Dorado and Tahoe National Forests. The results of this survey were published in Bulletin No. 56, "Survey of Mountainous Areas." Another land classification survey was performed by the Division of Water Resources and reported in State Water Resources Board Bulletin No. 10, "Placer County Investigation." Only that portion of the American River Hydrographic Unit that is in Placer County was included in Bulletin No. 10.

The land classification survey for this report utilizes these previous surveys as base material, however, irrigable agricultural lands and recreational lands were classified in greater detail and urban lands were completely remapped.

Results of the land classification survey for this report are shown on Plate 3, "Classification of Lands," Sheets 1 through 28. The total area in each classification is listed in Table 12.

Methods and Procedures

The general methods and procedures used in field mapping and tabulation of information were essentially the same as those described for the land use survey in Chapter III. An example of land classification delineations on an aerial photograph is shown on Page No. 107.

The standards used in the classification of lands are given in detail in Table 13.

Major Categories of Land Classes

The lands mapped were grouped into four major categories: (1) irrigable lands, (2) urban lands, (3) recreational lands, and (4) miscellaneous lands, which are those lands which failed to meet the requirements of the first three land class categories.

Irrigable Lands

Irrigable lands were grouped in appropriate classifications according to their suitability for development under irrigated agriculture and their crop adaptability. Presently irrigated lands were included within these classifications, but urban lands and recreational lands were not classed as to irrigability. The time element with respect to when the lands might be developed was not considered, although

Example of Land Classification Delineated on Aerial Photograph
(See Table 13 for explanation of symbols)

suitability for irrigated agriculture was considered in light of present agricultural technology.

There are many factors which influence the suitability of land for irrigation development. Since soil characteristics and the physiography of the landscape are the most stable of these factors, they were the only ones considered in classifying lands as to their irrigability. Soil characteristics were established by examination of road cuts, ditch banks, and material from test holes, together with observations of type and density of native vegetation and crops. Representative land slopes were measured with a clinometer. Other aspects, such as economic factors related to the production and marketing of climatically adapted crops, and the location of lands with respect to a water supply, were not considered in the basic classification. These latter factors are very important in estimating the nature of future cropping patterns and practices. They will be given due consideration when estimates are made of future water requirements.

Urban Lands

It is recognized that future urban expansion will encroach upon some irrigable lands but the location and extent of urban encroachment is a function of many variables. This land classification survey was an inventory of relatively unchanging physical conditions, and location of possible areas of urban encroachment was not considered. Only those lands devoted to urban uses in 1960 were designated as "urban lands."

Recreational Lands

Present trends indicate an expanding demand for recreational facilities throughout the State. In view of these trends it is recognized that there will be an increasing demand for substantial land areas for recreational purposes. This is particularly true of the mountainous regions where recreational development is expanding rapidly at the present time.

Most mountainous lands are suitable for some recreational use such as hunting, fishing, and similar outdoor activities. However, for purposes of this survey, lands classified as suitable for recreational use were limited to those which are now, or may in the future be used intensively for permanent and summer home tracts, camp and trailer sites, and parks outside urban areas. These are lands requiring intensive water service.

Primary considerations for classification of home tracts and camp and trailer sites were such physical factors as soil depth, slope, and rockiness; such aesthetic values as view, nearness to lakes or streams, or density and type of forest canopy suitable for the respective uses; and the plans of federal and state forest officials. An important factor in location of camp and trailer sites is availability of water supply, but isolation from existing roads did not influence site selection.

Miscellaneous Lands

Forest management lands, marshlands, and other lands are included as miscellaneous lands.

Forest management lands are those forested lands, rangelands, or lands subject to forest management which are physically susceptible to irrigation development but which, because of climatic conditions or physiographic position, are better suited for and are expected to remain under their present uses. These lands were designated in the land use survey as "F" lands.

Marshlands, which were designated as "Vm" lands, are those lands which generally have water standing on them and usually support a heavy growth of tules or other phreatophytes.

Lands which failed to meet the requirements previously described in this chapter were classified as "Other Lands" or "N" lands and amount to 862,784 acres, or 72 percent of the area of the hydrographic unit.

Lands included within (1) reservoirs completed since the year of survey or (2) reservoirs which have been placed under construction since the year of survey are tabulated under "N" lands. The water surface of reservoirs existing at the time of survey were classed as "N" lands including Folsom Reservoir with an area of 11,450 acres.

TABLE 13

LAND CLASSIFICATION STANDARDS

Symbol :	Characteristics
<u>Irrigable Lands</u>	
V	These lands are level or slightly sloping and vary from smooth to hummocky or gently undulating relief. The maximum allowable slope is 6 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils have medium to deep effective root zones, are permeable throughout, and free of salinity, alkalinity, rock, or other conditions limiting crop adaptability of the land. These lands are suitable for all climatically adapted crops.
H	These are lands with greater slope and/or relief than those of the V class. They vary from smooth to moderately rolling or undulating relief. The maximum allowable slope is 20 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.
M	These are lands with greater slope and/or relief than those of the H class. They vary from smooth to steeply rolling or undulating relief. The maximum allowable slope is 30 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.
The foregoing may be modified, as conditions warrant, by use of one or more of the following symbols.	
w	Indicates the presence of a high-water table, which in effect limits the present crop adaptability of these lands to pasture crops. Drainage and a change in irrigation practice would be required to affect the crop adaptability.

TABLE 13 (continued)

LAND CLASSIFICATION STANDARDS

Symbol :	Characteristics
s	Indicates the presence of an excess of soluble salts or exchangeable sodium in slight amounts, which limits the present adaptability of these lands to cropstolerant to such conditions. The presence of salts within the soil generally indicates poor drainage and a medium to high-water table. Reclamation of these lands will involve drainage and the application of small amounts of amendmets and some additional water over and above crop requirements in order to leach out the harmful salts.
ss	Indicates the presence of an excess of soluble salts or exchangeable sodium in sufficient quantity to require the application of moderate amounts of amendmets and some additional water over and above crop requirements in order to effect reclamation.
sa	Indicates the presence of an excess of soluble salts or exchangeable sodium in sufficient quantity to require the application of large amounts of amendmets and some additional water over and above crop requirements in order to effect reclamation.
h	Indicates very fine textures, which in general make these lands best suited for the production of shallow-rooted crops.
l	Indicates fairly coarse textures and low moisture-holding capacities, which in general make these lands unsuited for the production of shallow-rooted crops because of the frequency of irrigations required to supply the water needs of such crops.
p	Indicates shallow depth of the effective root zone, which in general limits use of these lands to shallow-rooted crops.
r	Indicates the presence of rock on the surface or within the plow zone in sufficient quantity to prevent use of the land for cultivated crops.

TABLE 13 (continued)
LAND CLASSIFICATION STANDARDS

Symbol :	Characteristics
-(L)	Indicates ground cover varying from a light to moderately dense growth of low brush through a low density growth of medium height trees.
-(M)	Indicates ground cover varying from a high density growth of low brush through a moderately dense growth of medium height to tall trees.
-(H)	Indicates ground cover varying from a high density growth of medium height trees through a very dense growth of large trees.
-2, -4 -6, -8	Number indicates in feet the average difference between highs and lows due to microrelief.
-B	Indicates low-lying basin and seep areas.

Urban and Recreational Lands

UD	The total area of cities, towns, and small communities presently used for residential, commercial, recreational, and industrial purposes.
SR	Existing and potential suburban residential areas which have a low population density. These lands are further subdivided into either a high or low water using category. This is indicated by a number in the symbol, i.e., SR-1 includes those lands where it is expected the entire area will be utilized for lawns, gardens, small orchards, etc., and has a high water use. SR-2 indicates lands where a large percentage of the area is expected to be nonwater using, hence an area of low water use. All the SR lands are also classed according to the four major topographic classes used for the classification of irrigable lands, i.e., V, H, M, and N.
RR	Existing and potential permanent and summer home tracts within a primarily recreational area. The estimated number of houses, under conditions of full development, is indicated by a number in the symbol, i.e., RR-3 is suitable for three houses per acre.

TABLE 13 (continued)
LAND CLASSIFICATION STANDARDS

Symbol :	Characteristics
RC	Existing and potential commercial areas which occur within a primarily recreational area and which include motels, resorts, hotels, stores, etc.
RT	Existing and potential camp and trailer sites within a primarily recreational area.
PP	Existing racetracks, fairgrounds, and private, city, county, state, and federal parks.

Miscellaneous Lands

- | | |
|----|--|
| F | Presently forested lands, or lands subject to forest management, which meet the requirements for irrigable land but which, because of climatic conditions and physiographic position, are better suited for timber production or some type of forest management program rather than for irrigated agriculture. |
| Va | Smooth lying valley lands which are affected by such heavy concentrations of salts that further detailed studies would be required to determine the feasibility of reclaiming these lands for irrigated agriculture. |
| Vm | Swamp and marsh lands which usually support a heavy growth of phreatophytes and are covered by water most of the time. |
| N | Includes all lands which fail to meet the requirements of the above classes. |

CHAPTER V. SUMMARY

The American River Hydrographic Unit comprises the 1,863 square mile drainage area of the American River above Folsom Dam. Most of the terrain in the unit is mountainous. Valley and foothill lands constitute 29 percent of the total area. Lumbering and associated wood products manufacturing are the most important industry with four of the largest firms accounting for about one-third of the wages and salaries within the unit. Although agriculture is the second most important industry in the unit, its growth rate has been relatively slow. Approximately 8 percent of the presently cultivated lands are dry-farmed, and 92 percent are irrigated. The major irrigated lands are devoted to deciduous orchard and pasture. Mining and hydroelectric power development are also important local activities. The largest town in the unit is Placerville, with a 1960 population of 4,439. Other large communities are Auburn, Colfax, and Foresthill.

Water Use

Apparent water rights in the American River area were determined for each diversion when possible. Most of the diversions are based on appropriative rights, many of which were established prior to the enactment of the Water Commission Act of 1914, and are not on record, since such rights could be established simply by actual diversion and use of the water.

As of October 1, 1963, a total of 601 currently valid applications to appropriate water in the unit were on file with the State Water Rights Board. Permits or licenses have been granted for 556 of these applications, 12 were pending, and 33 were incomplete.

Of the 249 surface water diversions located, 57 diversions were measured during 1960. The primary uses and amounts diverted are summarized below:

<u>Primary use</u>	<u>Diversions located</u>	<u>Diversions measured</u>	<u>Amount measured (acre-feet)</u>
Irrigation	143	30	49,818
Municipal	7	1	252
Industrial	6	0	0
Mining	9	4	1,659
Power	16	6	86,118
Domestic	19	0	0
Stockwatering	6	0	0
Recreation	10	0	0
Other	<u>33</u>	<u>16</u>	<u>1,593</u>
TOTAL	249	57	139,440

The total consumptive use of applied water in the American River Hydrographic Unit is estimated to have been about 19,100 acre-feet in 1960. Of this total about 16,700 acre-feet were consumed by irrigation, 2,200 by municipal and domestic uses, and the remainder by industrial operations. Consumptive use of applied water for other purposes is negligible.

Land Use

Results of the 1960 detailed land use survey conducted in the American River Hydrographic Unit are summarized below and presented pictorially in Figure 1.

<u>Use</u>	<u>Area, in acres</u>
Agricultural lands	
Lands irrigated in 1960	10,790
Lands normally irrigated but idle or fallow in 1960	245
Meadowlands	2,886
Dry-farmed lands	974
Total agriculture	14,895
Recreational lands	7,252
Urban lands	5,962
Native vegetation	
Water surface of Folsom Lake	11,450
Other lands (including Marshlands)	<u>1,152,810</u>
Total native vegetation	<u>1,164,260</u>
TOTAL AREA OF UNIT	1,192,369

Land Classification

An agricultural land classification survey was conducted in the western part of the unit in 1950. In 1961 and 1962 a detailed survey was conducted for the entire American River Hydrographic Unit with reference to previous base material. Results of this survey are summarized below and presented pictorially in Figure 2.

<u>Classification</u>	<u>Area, in acres</u>
Irrigable agricultural lands	122,472
Present urban lands	5,958
Recreational lands	22,746
Miscellaneous lands	
Irrigable forest management lands	178,384
Water surface of Folsom Lake	11,450
Other lands (including Marshlands)	<u>851,359</u>
TOTAL AREA OF UNIT	1,192,369

APPENDIX A

STATEWIDE WATER RESOURCES AND WATER
REQUIREMENTS PROGRAM

APPENDIX A

STATEWIDE WATER RESOURCES AND WATER REQUIREMENTS PROGRAM

California's major water problem today is that of development and delivery of supplemental water supplies to meet increasing water requirements throughout the State. The problem involves (1) the regulation of seasonal and cyclic fluctuation of streamflow to meet demand schedules in the areas of origin and (2) the transmission of regulated surplus flows over long distances to areas of deficiency. The development and long distance transfer of water is currently accomplished by such major facilities as the federal Central Valley Project and the Colorado River Aqueduct of The Metropolitan Water District of Southern California. However, such development and transfer will be considerably broadened in scope by the State Water Facilities.

Consumptive water requirements of the State on a basinwide basis were estimated in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," June 1955. However, to provide for local water needs while considering specific export projects, more detailed information must be made available on present and projected future water requirements of the areas in which the projects are to be built. This will necessitate the considerably more detailed collection and analysis of data on hydrology, land use and land capability, and economics.

Recognizing that additional information is needed if the water needs of areas of origin are to be adequately protected in large-scale water development projects, the 1956 Legislature authorized an investigation to determine the water resources and water requirements of the respective watersheds in the State. The authorization is contained in Chapter 61, Statutes of 1956 as amended by Chapter 2025, Statutes of 1959. This legislation is codified in Section 232 of the Water Code as follows:

"232. The legislature finds and declares that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial uses therein. To this end, the department is authorized and directed to conduct investigations and hearings and to prepare findings therefrom and to report thereon to the Legislature at the earliest possible date with respect to the following matters:

(a) The boundaries of the respective watersheds of the State and the quantities of water originating therein;

(b) The quantities of water reasonably required for ultimate beneficial use in the respective watersheds;

(c) The quantities of water, if any, available for export from the respective watersheds;

(d) The areas which can be served by the water available for export from each watershed; and

(e) The present use of water within each watershed together with the apparent claim of water right attached thereto, excluding individual uses of water involving diversions of small quantities which, in the judgment of the Director of Water Resources, are insufficient in the aggregate to materially affect the quantitative determinations included in the report.

"Before adopting any findings which are reported to the Legislature, the department shall hold public hearings after reasonable notice, at which all interested persons may be heard."

For purposes of this investigation, the State has been divided into 12 major hydrographic areas. These areas, in turn, have been subdivided into hydrographic units generally comprising watersheds of individual rivers. These watersheds will be field surveyed in some detail, and where previous detailed studies have been made, the information will be brought up-to-date. Water resources and water requirements will be determined and reported in a bulletin for each of the hydrographic areas. Since it requires many years to gather sufficient data to make adequate analyses of water resources and water requirements, and in order to make the data on present land and water use available when they are most useful, surveys of land and water use will be made and published separately for each of the hydrographic units. Bulletin No. 94-14, "Land and Water Use in American River Hydrographic Unit," is the fourteenth of a series reporting the results of these surveys.

At a future date, estimates largely based on the land and water use surveys, will be made of quantities of water reasonably required for future beneficial uses in each watershed. The quantity of water potentially available for export from each watershed will be determined after allowances are made for the satisfaction of the local requirements and prior rights to divert water to other areas. For those watersheds in which no exportable water is available, the water

supply deficiency will be determined. These estimates will be published as they become available in such form as to make possible a county-by-county determination.

The calculations of future water requirements will be based on predicated future land uses derived from land classification surveys, economic studies, population forecasts, industrial and agricultural development, and recreational needs. Agricultural water requirements will be based on unit water use by the various predicated crop types; urban and recreational requirements on per capita water use values; fish and wildlife requirements on minimum streamflow needed or water demands for wildlife area; and industrial water requirements on measured water deliveries to various types and sizes of industries now existing. In forecasting future industrial development, water quality problems will be given full consideration.

Water resources will be determined from records of all stream gaging stations, including new stations which were established for this and other investigations of the department. The new stations were generally constructed on streams which originate in the smaller watersheds for which runoff data are necessary but for which no data have been available.

APPENDIX C

LEGAL CONSIDERATIONS

There are set forth in the following paragraphs brief general statements with respect to the California law of water rights to supplement and to provide a background for information on water rights contained in Chapter II. Also included is a tabulation of currently active applications to appropriate water within American River Hydrographic Unit filed with the State Water Rights Board.

California Water Rights

In California, water rights convey only the right to use water. Until absolute possession of water is acquired by some artificial means, no one owns water. However, the owner of water rights is entitled to enjoy them without interference by other users who have rights which are inferior to his.

Five kinds of water rights are recognized in California. These are riparian, overlying, appropriative, prescriptive, and pueblo. Riparian rights attach to surface water and water flowing in known and definite subterranean channels, while overlying rights attach only to underground water. Appropriative and prescriptive rights may be acquired in either surface or underground waters. Pueblo rights are now exercised in California only by the Cities of Los Angeles and San Diego, each of which has a paramount right to satisfy its full needs from the stream system of waters flowing by the former Mexican pueblo from which each sprang.

All water rights, both to surface and to underground water, are subject to the doctrine of reasonable beneficial use expressed in Section 3 of Article 14 of the California Constitution, and Water Code Sections 100 and 101. This doctrine limits water rights to the quantity of water reasonably required for beneficial use and prohibits waste, unreasonable use, and unreasonable methods of use or diversion.

Riparian Rights

A riparian right entitles the land owner to take water directly from a natural watercourse for use on lands which border or have frontage on the watercourse. However, the rights of the owner of riparian land are limited to the reasonable beneficial use of the natural flow of water which passes his land. Riparian rights pass with the title to the land, unless expressly reserved or excepted from the interests transferred, and are not gained by use or lost by mere nonuse. Although the land must be contiguous to the watercourse, the length of the frontage is not determinative of the rights; a large tract with a small frontage on a stream, may be riparian to the stream. But the original grant determines the character of the land, and only the smallest contiguous tract held under a single title retains riparian rights.

A riparian owner has no right to any specified amount of the water of a stream as against other riparian owners. He has rights only to a reasonable share from the stream -- a correlative right which he shares mutually with other riparian owners. In the event of insufficient water

for all, the available supply must be apportioned, except that an upper riparian owner may take the whole supply if necessary for domestic use. As against appropriators, the riparian owner has the paramount right to all the water of the stream which he can put to reasonable beneficial use, but that is the extent of his rights, and the appropriator can take the surplus.

Riparian rights do not authorize use of water on non-riparian land, nor do they permit the seasonal storage of water. Neither do they prevent temporary appropriation by others of water not presently needed for use on riparian land.

A parcel of land becomes nonriparian when severed from land bordering the stream, unless the riparian rights are reserved for the severed parcel by the grantor. Riparian rights may be destroyed when purportedly transferred apart from the land by grant, contract, or condemnation, and may be impaired or lost through prescription.

Overlying Rights

Owners of lands overlying a common underground water supply have the right to withdraw water for reasonable beneficial use on their overlying lands. Such overlying rights are analogous to riparian rights, in that both are based on ownership of land, and the rights of each overlying owner are mutual and correlative to the rights of all other owners. In the case of insufficient water to fully supply the requirements of all, the available supply must be equitably apportioned.

Overlying rights do not include use of water on non-overlying land. However, surplus water not presently required for beneficial use on overlying land, and which may be withdrawn without creating an overdraft on the ground water supply, may be appropriated for use on nonoverlying land. But the overlying rights are paramount and all appropriative rights are subject to the future requirements of overlying land.

Appropriative Rights

An appropriation of water is any taking of water for other than riparian or overlying uses, whether such taking is from the underground by wells or from surface streams by direct diversion or storage. An appropriator, in the legal sense, is one who initially takes water without possessing rights which are based on the ownership of land. As between appropriators, the one first in this is first in right. A prior appropriator may take all the water he needs up to the full amount to which he is entitled before a later appropriator may take any.

Normally, appropriative rights are inferior to riparian rights. An exception to this is the case of an appropriation of water diverted from streams flowing through vacant public lands before the riparian lands were withdrawn from the domain of the United States. The appropriative diversions or the lands they serve may be either upstream or downstream from the riparian lands. Any water not need for the reasonable beneficial uses of those having prior rights may properly be appropriated.

No formal or statutory procedure is or ever has been prescribed or required in this state for those who take water by means of wells from underground percolating waters or underground basins. An appropriative right to take surplus water from such sources is acquired by extracting such water from the underground and applying it to beneficial uses.

Provided the development and application to use are completed with reasonable diligence, the priority of the right as against another appropriator related back to the first substantial act toward putting the water to use or to the date of application. Until 1872, water flowing in natural streams was appropriated by taking the water.

Sections 1410 through 1422 of the Civil Code, enacted in 1872, established a permissive procedure for perfecting an appropriation of surface water. Provision was made for posting a notice of appropriation at the proposed point of diversion and recording a copy with the county recorder. If the statutory procedure were followed and the appropriation completed with due diligence, priority related back to the date of posting; otherwise, priority was established only when the water was put to beneficial use.

Since the effective date of the Water Commission Act of 1913, December 19, 1914, appropriation of surface water and water in subterranean streams flowing in known and definite channels has been by compliance with required statutory procedure. An appropriation of such water now can be made in accordance with the provisions of Part 2, Division 2 of the Water Code (Water Code Sections 1200 to 1801). An application

to appropriate unappropriated water must be filed with the State Water Rights Board. If the application is approved, a permit is issued authorizing the appropriation. When the appropriation has been completed, an inspection is made and a license is issued, to the extent of beneficial use, provided the terms and conditions of the permit have been fulfilled. The priority of a permit or license relates back to the date of the appropriation.

A right to appropriate water may be lost either by abandonment or by continuous nonuse. To constitute abandonment, there must be concurrence of act and intent, wherein possession is relinquished with no intent to resume it for a beneficial use. Abandonment is, therefore, always voluntary and factual. In the case of an appropriation initiated prior to 1914, continuous nonuse for a period of five years results in the loss of appropriative water rights. In the case of appropriative rights acquired pursuant to the Water Commission Act or the Water Code, continuous nonuse for a period of only three years may result in loss of such rights.

Where ground water and surface water are interconnected, one acting as a tributary to the other, both are treated as part of a common supply and users of water from either source are entitled to protection from substantial injury as a result of use by others of water from the other source. Thus, an owner of land riparian to a stream may have his right to the use of water protected against impairment by an appropriator of percolating ground water tributary to the stream and required for the maintenance and support of its

flow. Likewise, where water from a stream percolates to a ground water basin or stratum, the owner of land overlying the ground water supply may be protected from an appropriation of water from the stream if this causes a substantial impairment of the ground water supply. As between riparian use of surface water and overlying use of ground water tributary to the stream, a sharing of the available water supply on the basis of reasonable beneficial use should be made.

Prescriptive Rights

It is possible to appropriate surface or ground water which is presently needed by others to satisfy riparian, overlying, or prior appropriative rights. Such appropriations may ripen into prescriptive rights where the use is actual, open and notorious, hostile and adverse to the original owners, continuous and uninterrupted for the statutory period of five years, made under claim of right, and with payment of taxes whenever such have been levied on the water rights. Absence of any of these essentials precludes the acquisition of prescriptive water rights.

Prescription thus requires that where the rightful owner for a period of five years, either knows or should know of the adverse taking and fails to take any physical or legal steps to interrupt such taking. An absolute right is acquired to a fixed amount of water by prescription, the quantity being determined by beneficial use, irrespective of the needs or demands, of the injured riparian, overlying, or prior appropriative user. However, present use is the measure

of the prescriptive right, and future needs cannot be included.

Riparian rights, overlying rights, appropriative rights, and prescriptive rights may be lost or diminished by prescription. While there is sufficient water flowing in a stream to supply the wants of all parties, the use of the water by anyone does not deprive the others of their water supply and, hence, is not an invasion of their rights. The same principle applies to a downstream diversion of water as against the rights of an upstream riparian landowner or prior appropriator. At times when the safe yield of a ground water basin exceeds the needs of overlying landowners and appropriators, their prior rights are not invaded by a later appropriative taking of water from the underground supply. The later appropriation becomes adverse only when the ground water basin is overdrawn; that is, when the annual draft exceeds the safe annual yield. Although neither an overlying owner nor a prior appropriator may prevent a taking of surplus water, either the owner or the appropriator may institute legal proceedings to safeguard the supply once a surplus ceases to exist, and may enjoin any additional use beyond the point of safe yield. Since prescriptive rights can only be acquired to nonsurplus water, these rights cannot ordinarily be acquired against the future needs of riparian or overlying owners.

The prior appropriator, lower riparian, or overlying owner may protect his rights for his present needs against an adverse appropriator by actually taking the needed water before the five-year period has run, or by the aid of the courts

in the form of a declaratory judgment or injunction within the five-year period.

Determination of Water Rights

Under provisions of the Water Code, actions involving determination of rights to the use of water brought before either state or federal courts may, at the court's discretion, be referred to the State Water Rights Board. Under provisions of Water Code Section 2000, the court may appoint the board to referee "any or all issues involved in the suit," or under Section 2001, it may limit the reference to "investigations of and report upon any or all physical facts involved." This reference procedure may be followed in suits involving either surface or ground waters, or both.

An alternative procedure is available for adjudication of rights to the use of water of streams, lakes, and other bodies of water, but the method excludes the determination of rights to take water from an underground supply other than from a subterranean stream flowing through known and definite channels. Water Code Sections 2500 to 2900, inclusive, authorize the initiation of such proceedings.

Litigation Concerning Local Water Rights

There has been no major adjudication of water rights in the American River Hydrographic Unit. Consequently, neither the State Water Rights Board nor any of its predecessor agencies have been involved in a court reference, and state watermaster service has not been established.

However, the first legal proceedings in the history of conflict in the matter of use of water from the American River and its tributaries were entered on July 18, 1898, in the case of Sacramento Electric, Gas and Railway Company vs. C. W. Clarke, H. G. Smith, and A. N. Buchanan, Superior Court, Sacramento County, No. 7815, in which the rights between plaintiff and defendants were then determined. Included in the following pages is a copy of the above decree.

Applications to Appropriate Water

Applications to appropriate water within the American River Hydrographic Unit, filed with the State Water Rights Board since 1914 and active on October 1, 1963, are summarized in Table C-1. Those diversions, for which an application to appropriate water is filed with the State Water Rights Board which were found in this survey to be of a predetermined amount have been assigned diversion numbers which are included in the table. The status of each application as to the granting of a permit or license is also shown in the table.

In the Superior Court of the County of Sacramento,

State of California

-----oooooooo000000oooooooo-----

Sacramento Electric, Gas and Railway
Company, (a corporation,)

Plaintiff,

vs.

C. W. Clarke, H. G. Smith, and A. N.
Buchanan

Defendants.

-----oooooooo000000oooooooo-----

This cause came on regularly for trial on the 18th day of July, 1898, before Hon. Joseph W. Hughes, Judge of said Court, sitting in Department Number One thereof, without a jury, a jury having been expressly waived.

L. T. Hatfield, Esq., appeared as Attorney for Plaintiff, and Catlin, Shinn & Catlin, as Attorneys for Defendants, and from the evidence introduced, the Court finds the facts as follows, to wit:

1.

That the plaintiff is the owner of, and in possession of a canal and dam across the American River; that plaintiff's right thereto commenced May 8th, 1872, by giving due notice thereof, and said dam and canal were completed so as to make use of the water therein in January 1893, and were fully completed July 10th, 1895. Said dam is situated at the point described

in the complaint, which is about one mile below the junction of the North Fork and the South Fork of the said American River, and said canal is about 9,000 feet long, extending from said dam to the town of Folsom.

2.

Plaintiff has diverted from said American River, and into said canal only 50,000 cubic feet of water per minute, and has used the same for beneficial purposes; and plaintiff's appliances require 65,000 cubic feet of water per minute through said canal at this time.

3.

The dam of defendants is across the North Fork of the American River at a point as alleged in said complaint, and at a distance of about twenty-two miles above the dam of plaintiff.

4.

Defendants' grantors, a long time prior to any appropriation by Plaintiff or its grantors, to-wit: In the year 1854, entered upon the said North Fork of the American River and constructed said dam and canal and diverted 3,000 inches of the waters of said River, measured under a four-inch pressure, equal to 3,600 cubic feet per minute, measured immediately below the first waste gate in said canal below said dam, for sale, rental and distribution for mining, mechanical and agricultural purposes, and even since have used, distributed and sold the same for such purposes.

5.

That defendants have not at any time, since the appropriation by plaintiff, diverted from said stream a quantity of water greater than three thousand inches measured under a four-inch pressure.

6.

That plaintiff has not been damaged by any diversion of said water by defendants.

7.

The low water season mentioned in the complaint during which plaintiff is alleged to take all of the natural flow of the American River does not extend through the months of June or November, but does extend through the months of August, September and October of the average years.

*** Conclusions of Law. ***

1.

The defendants are entitled to, and have, a prior appropriation of three thousand inches of the waters of the North Fork of the American River, measured under a four-inch pressure, taken immediately below the first waste gate below their dam, for sale, rental and distribution for agricultural, mining and mechanical purposes at all seasons of each year.

2.

That plaintiff is not entitled to recover any damages from the defendants.

3.

Plaintiff is not entitled to the injunction prayed
for in its complaint.

Let judgment be entered accordingly.

Aug 5th 1898.

(Signed) Joseph W. Hughes

Judge of the Superior Court,

APPENDIX D

DETAILED DESCRIPTIONS OF CERTAIN SURFACE WATER DIVERSIONS

This appendix presents additional data on surface water diversions by El Dorado Irrigation District, Georgetown Divide Public Utility District, and Pacific Gas and Electric Company which could not be described adequately in Table 6 of this report. The points of diversion and the diversion ditch systems are delineated in detail on the various sheets of Plate 2.

El Dorado Irrigation District

With the discovery of gold in 1848, the demand for water soon resulted in the construction of many ditches by the miners in an effort to bring water from the snow fed streams to the gold-laden gravels. One of the larger undertakings was the construction of the South Fork and Placerville Canal in 1851, extending from Weber Creek to Coon Hollow, south of Placerville. In 1852 north of Camino, Iowa Canal conveyed water to Iowa Canyon and later was extended to Long Canyon. The most profitable of the early ditches constructed was Gold Hill Ditch. This canal extending from Placerville to Gold Hill was able to sell water over and over again to the miners in the same area.

In 1856 John Kirk of Placerville posted his first notice of appropriation claiming water of the South Fork American River. Surveys were made, damsites located, and by

1872 the first section of ditch started near Sportsman Hall. Due to a lack of capital, Kirk's plan to bring water to the Placerville area was never completed.

In 1873 the El Dorado Water and Deep Gravel Mining Company, through a series of purchases, obtained the rights and holdings of Kirk and certain other valuable lands in the area. In 1876 water from the South Fork American River was conveyed to the Placerville area. Over the years the property belonging to the El Dorado Water and Deep Gravel Mining Company has changed hands many times. In the early 1920's that section of the El Dorado Canal from the South Fork American River to the El Dorado Forebay was purchased by Western States Gas and Electric Company, a predecessor of the Pacific Gas and Electric Company. The Main Canal, including all associated ditch systems and properties below the El Dorado Forebay, was purchased by the El Dorado Water Company, predecessor of the El Dorado Water Corporation. In 1927 the El Dorado Water Corporation sold its properties to the El Dorado Irrigation District which had been organized in 1925. Between the South Fork American River diversion point (D11N/15E-29Q1) and the forebay, the conduit is known as the El Dorado Ditch, utilized by the Pacific Gas and Electric Company to transport water for hydroelectric power and for deliveries to the El Dorado Irrigation District.

From the El Dorado Forebay, the El Dorado Irrigation District's Main Canal travels along the ridge between the South Fork American River and Weber Creek to Smith Flat supplying the Sportsman Hall, Camino, and Smith Flat areas

enroute. North of Smith Flat the Negro Hill Ditch runs westward to the area north of Placerville where it serves the Luse Ditch. From Smith Flat the Main Canal runs southwest to a junction with the New Weber Ditch near Texas Hill. Here deliveries are made to the Placerville municipal reservoirs. From the reservoir area the Main Canal turns south crossing Weber Creek, joining the Diamond Ditch to supply the Missouri Flat and Farmers Ditches.

In addition to the El Dorado Irrigation District's Main Canal, there are four district diversions and one independent diversion, used conjunctively, which bring water supplies into the district. The following is a description of each diversion:

New Weber Ditch (D10N/12E-18Q1). Construction of Weber Reservoir on North Fork Weber Creek was started by the El Dorado Water Corporation in 1922. The triple arch dam had a design height of 110 feet. Beset by financial troubles, the corporation was unable to complete the project but put the partially completed dam, at a height of 89 feet, into operation in 1924. The present storage capacity is 1,275 acre-feet. Flows to the New Weber Ditch are released via a 24-inch diameter pipe through the north arch near the right abutment. The ditch follows approximately the 2,400-foot contour, north of Weber Creek Channel to the Cedar Ravine Road where it joins the El Dorado Irrigation District's Main Canal.

Sly Park-Camino Conduit (D10N/12E-14L1). Sly Park Dam, which impounds Jenkinson Lake with a capacity of 41,033 acre-feet, was constructed in 1955 by the United States

Bureau of Reclamation as part of the Central Valley Project on Sly Park Creek in the Cosummes River Basin. It is an earth and rockfill dam 172 feet high and 760 feet long at the crest. Deliveries to the El Dorado Irrigation District are made through 5.6 miles of steel pipe and 0.5 mile of tunnel to the district's Main Canal just west of Camino. Deliveries of about 20,000 acre-feet are made annually. Water diverted through the Sly Park-Camino Conduit is reported as an import in Table 8.

Storage in Jenkinson Lake is supplemented by a small diversion from Camp Creek through the Camp Creek Tunnel to the reservoir. Camp Creek Diversion Dam is a concrete overflow weir type dam 20 feet high and 70 feet long at the crest. Flow is diverted through a 7.0-foot diameter concrete-lined tunnel 2,855 feet long.

Diamond Ditch (D10N/11E-19P1). Diamond Ditch is part of the Diamond Ditch System which has continuously appropriated and delivered water since 1852. The ditch diverts from Squaw Hollow Creek, a tributary of North Fork Cosummes River, and imports to the El Dorado Irrigation District area southwest of Placerville through an open ditch and enters the unit east of Diamond Springs. The ditch then turns northwestward to join the district's Main Canal. About 1,700 acre-feet are diverted annually through the ditch.

Gold Hill Ditch (D10N/11E-7P1). The Gold Hill Ditch constructed in 1853 by the Gold Hill Canal Company, diverts the augmented flow of Hangtown Creek near the west edge of Placerville. From the diversion a concrete pipe connects to

a lined canal extending from Placerville to the Gold Hill area. This canal has helped in bringing about the development of one of the richest fruit-growing areas in the Sierra foothill region.

Farmers Ditch (D10N/11E-19F1). Farmers Ditch heads on Weber Creek above the bridge on the Diamond Springs road. This ditch was constructed by the American River Deep Gravel and Water Company in 1862. Originally known as the Missouri Flat Ditch, it served landowners south of Weber Creek near Missouri Flat. After a series of different ownerships ending in a sheriff's sale, possession of the ditch went to a group of ranchers and came to be known as the Farmers Free Ditch. On April 1, 1930, an agreement was reached between the ranchers and El Dorado Irrigation District whereby the ranchers would purchase water at the district's prevailing rate during the irrigation season. The district maintains the ditch as part of its system and serves other users along the ditch. The original diversion right of 40 miner's inches was retained by the ranchers and is exercised during the nonirrigation period.

Georgetown Divide Public Utility District

The Georgetown Divide Public Utility District serves the area in the northwest portion of El Dorado County between the Middle Fork and South Fork American Rivers. The district was incorporated on June 11, 1946, under the Public Utility Act of 1921 and stemmed from the desire of the people in the area to obtain a more adequate water supply. The district comprises approximately 64,600 acres of foothill and

mountainous lands of which about 30,500 acres are classed as irrigable.

The Georgetown Divide Ditch System was originally constructed about 1852 through a concerted effort of three companies: Pilot and Rock Creek Company, New York and Ohio Water Company, and Pilot Creek Ditch Company. A succession of owners followed, until 1952 when the Georgetown Water Company sold the entire system to the Georgetown Divide Public Utility District.

The ditch system's first diversion was located on Pilot Creek, a tributary of the Rubicon River. Subsequent development took place during the period 1874 to 1883 with the construction of Loon Lake Dam and a canal which brought water from the Upper Rubicon River area into the Pilot Creek drainage. From Pilot Creek flows were rediverted into the Georgetown Divide Ditch.

At present water supplies in the upper basin area are obtained from storage at Loon Lake and by gravity diversions from Gerle Creek and South Fork Rubicon River. However, the upper basin facilities and rights to water have been sold to Sacramento Municipal Utility District. Consummation of this sale is contingent upon construction of Stumpy Meadows Dam and Reservoir on Pilot Creek. The regulated water from Stumpy Meadows Reservoir will supplant the waters now received from the upper basin. At this time, the transfer of rights to water in the upper basin to Sacramento Municipal Utility District will be completed and the facilities formerly

utilized by the Georgetown Divide Public Utility District will be abandoned.

Following is a description of each of the present diversions:

Loon Lake (D13N/15E-5H1). In the early 1870's the first storage was obtained at Loon Lake by construction of a small log crib dam. In 1881 and 1882 the California Water Company built the present masonry dam at Loon Lake, using funds obtained by a bond issue. Funds were depleted before completion of the dam, leaving it at a height of 26 feet. This height provided a storage capacity of about 8,000 acre-feet. Construction of the dam was from quarried blocks, hewed out of the massive granite formations of the upper basin. Some of these blocks weighed from 4 to 8 tons each. On the upstream face of the dam an earth fill was placed to prevent leakage through the masonry section of the dam.

In 1934 the Georgetown Divide Water Company increased the height of Loon Lake Dam to 28 feet, which increased the storage capacity of the lake to about 10,000 acre-feet. This was accomplished by using granite blocks which had been cut at the time that the original dam was built and left at one end of the dam when construction was terminated.

Gerle Creek (D13N/14E-15G1) and South Fork Ditch (D13N/14E-24B1). Both Gerle Creek Ditch diverting from Gerle Creek and the South Fork Ditch diverting from Little South Fork Rubicon River were constructed in the early 1870's by the California Water and Mining Company. Releases from

Loon Lake down the stream channel are diverted by Gerle Creek Diversion Dam to the Gerle Creek Ditch. South Fork Ditch, diverting from the South Fork Rubicon River, adds supplemental flow to Gerle Creek Ditch enroute to the Pilot Creek drainage.

Georgetown Divide Ditch (D12N/12E-12P1). Georgetown Divide Ditch, the main distribution canal for the Georgetown Divide Public Utility District, diverts from Pilot Creek, a tributary of the Rubicon River. From the Pilot Creek diversion the flow is conveyed about 26 miles to the city reservoir at Georgetown where distribution is made to major service laterals. From the distribution point near Georgetown, the Main Canal conveys smaller flows westward to terminate in the vicinity of Knickerbocker Creek.

Pacific Gas and Electric Company

The Pacific Gas and Electric Company was founded in October 1905. It was originally incorporated as a holding and operating company to take over California Gas and Electric Corporation and San Francisco Gas and Electric Company, both of which absorbed many other systems. Since its incorporation, continued acquisitions by mergers, lease agreements and outright purchases of both large and small generating and distributing concerns have combined to make Pacific Gas and Electric Company the largest public utility system in the world.

The first hydroelectric generating plant in Central California was built and put into operation on the American River by the Sacramento Electric Power and Light Company in 1895. In 1866 initial work was started by the Natomas Water

and Mining Company to supply power to the Folsom area. The project consisted of a diversion dam on the American River near Folsom, a canal and a generating plant which would return flows to the river. Only the diversion dam and part of the canal were completed by 1881 when the company reorganized as the Folsom Water Power Company. Construction progress again continued slowly until the power rights were leased by Sacramento Electric Power and Light Company, who built the power station and a 21.5 mile transmission line to Sacramento. The original equipment of this plant consisted of four 750 kilowatt generators with a potential of 11,000 volts. Power was delivered to Sacramento by this line on July 13, 1895. Ownership of the station and other project facilities was obtained by Sacramento Electric Gas and Railway Company in 1896, by California Gas and Electric Corporation in 1901, and finally by Pacific Gas and Electric Company in 1905.

To the north in the watersheds of the Yuba and Bear Rivers, the South Yuba Water Company operated a ditch system which was built in the 1850's to supply portions of Placer and Nevada Counties with water for hydraulic mining. With the passage of the debris control legislation, most of the hydraulic mining stopped, and the company had to find a new market for its water. About 1895, when electric transmission became a reality, the Central California Electric Company was formed as a subsidiary of the South Yuba Water Company to develop the power sites within the system.

The first plant constructed by the Central California Electric Company, located at Newcastle, began to transmit

power to Sacramento on December 31, 1896. A second plant, located about a mile northeast of Auburn, began operation on October 3, 1898. A third plant, Alta Powerhouse, was put into commission on November 7, 1902. Today, only Alta Powerhouse with reduced generating capacity remains in commission.

In 1893 the South Yuba Water Company expanded its facilities by construction of the Boardman Canal which provided needed irrigation service along the ridge between the Bear and American Rivers. At present the Boardman Canal and its associated works comprise several connected canals and numerous distribution laterals.

Through acquisition of the South Yuba Water Company in 1910, the Pacific Gas and Electric Company came into possession of what are now the South Yuba and Bear Rivers Power System and the Placer Water System.

The American River Electric Company, organized in 1903, constructed the American River Powerhouse to supply power to the Stockton area and local distribution points enroute. This plant is located on the South Fork American River northeast of Placerville and is the oldest of the American River Basin powerplants now in operation. In November 1910 the Western States Gas and Electric Company was incorporated to acquire and operate the properties of the American River Electric Company.

In the early 1920's the El Dorado Powerhouse was constructed on the South Fork American River northwest of Pollock Pines. This plant and the El Dorado Ditch were operated by Western States Gas and Electric Company. These

facilities were acquired by Pacific Gas and Electric Company with their purchase of Western States Gas and Electric Company in 1927.

South Yuba and Bear Rivers Power System

Water is imported to and exported from the American River Hydrographic Unit by the South Yuba and Bear Rivers Power System and Placer Water System complexes of the Pacific Gas and Electric Company. The principal sources of supply to these systems are the upstream storage facilities of the Drum Division of Pacific Gas and Electric Company on the South Yuba River.

In addition to water diverted and stored by Pacific Gas and Electric Company, water developed by Nevada Irrigation District is routed through the South Yuba and Bear Rivers Power System for the generation of power. The Nevada Irrigation District and Pacific Gas and Electric Company's South Yuba and Bear Rivers Power System are located in the Yuba-Bear Rivers Hydrographic Unit and are reported in detail in Bulletin No. 94-3 , "Land and Water Use in the Yuba-Bear Rivers Hydrographic Unit," Volume 1, September 1963.

Following are discussions of the diversion facilities within the South Yuba and Bear Rivers Power System that are pertinent to the American River Hydrographic Unit:

Drum Canal (D16N/11E-16L1). The Drum Canal was constructed in 1912-13 at the same time that Drum Powerhouse and Spaulding Dam were built. The construction was part of Pacific Gas and Electric Company's expansion to meet new

demands for power service. Releases from Lake Spaulding go through Spaulding Powerhouse No. 1 to the Drum Canal. The canal has a length of 8.5 miles to the Drum Powerhouse which is located on the Bear River.

In addition to the releases from Lake Spaulding, water is exported from the American River Hydrographic Unit to the Drum Canal via Lake Valley Canal near Emigrant Gap. Lake Valley Canal diverts from the North Fork of North Fork American River at D17N/12E-33B1. Although all the flows in the Drum Canal pass through the American River Hydrographic Unit, only that portion released from the Drum Forebay to Canyon Creek for rediversion in the Boardman Canal System is reported as an import. The major portion of the canal flow is released to the Bear River via the Drum Powerhouse.

Lake Valley Canal (D17N/12E-33B1). Lake Valley Canal diverts from the North Fork of North Fork American River to supplement the Drum Canal in the Yuba-Bear Rivers Hydrographic Unit. Flows in the canal are exported from the American River Hydrographic Unit in the vicinity of Emigrant Gap at D17N/12E-30R1. Winter flow in the North Fork of North Fork American River is stored and regulated upstream by Kelly Lake (D17N/12E-25F1) and Lake Valley Reservoir (D17N/12E-35C1). These reservoirs have a combined capacity of about 8,500 acre-feet. Releases made from late spring to early fall constitute most of the water diverted by Lake Valley Canal during this period.

South Canal (D12N/8E-32P1). The South Canal is the last segment of Bear River Canal System of Pacific Gas and

Electric Company Power Supply System in the Bear River drainage area. The Bear River Canal System diverts from the Bear River near Chicago Park (D15N/9E-22Q1) in the Yuba-Bear Rivers Hydrographic Unit. It is known as the Bear River Canal through its course to Halsey Forebay. From the tailrace of Halsey Powerhouse through Rock Creek Reservoir and subsequently through Wise Powerhouse located below Auburn, it is known as the Wise Canal. From the Wise Powerhouse tailrace to its spill into Mormon Ravine in the American River Basin, it is known as the South Canal. The principal source of water for this system, in addition to the natural flow of Bear River, are waters released from Lake Spaulding via the South Yuba Canal bypassing the Boardman Canal intake and the power releases from Drum Powerhouse.

South Canal was constructed in 1919 to convey water from Wise Powerhouse to the American River Basin. This is the only water imported to the unit by the Bear River Canal System. Enroute an interchange of water is effected between South Canal and Boardman Canal. Below Wise Powerhouse the South Canal supplies several laterals of the Boardman Canal, the last one being Lower Greeley Canal which services Monte Rio Pipe (D11N/8E-5B1).

South Canal extends into the American River Hydrographic Unit approximately 0.9 mile before it spills into Mormon Ravine. Enroute it picks up tail waters of Gaylord, Shirland, and Shirland Stub Canals, all laterals of the Boardman Canal.

Placer Water System

The Placer Water System provides municipal, industrial, and irrigation water to most of the area along the divide between the American and Bear Rivers. The principal area served is along Interstate Highway 80 from Baxter to Roseville. One powerhouse, Alta, is included in the system and operated in conjunction with Pacific Gas and Electric Company's Power System. Placer Water System and South Canal provide all of the water imported into this portion of the American River Hydrographic Unit. Laterals of the system that enter the unit are classed as imports and the location numbers are shown in the tables and on Plate 2. The Placer Water System is described in detail in Bulletin No. 94-3, "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit," Volume 1, September 1963.

Following are discussions of the diversion facilities within the Placer Water System pertinent to the American River Hydrographic Unit:

Boardman Canal (D16N/11E-16M1). Boardman Canal is the main stem of the Placer Water System. Water is first diverted from the Bear River about 1 mile below State Highway 20 at D17N/11E-36D1 in the Yuba-Bear Rivers Hydrographic Unit, and conveyed via the Upper Boardman Canal to Canyon Creek in the American River Watershed. The Boardman Tunnel conveys the flow into the unit at D16N/11E-16M1 immediately below the Drum Forebay. Although the Boardman Canal intake heads on the Bear River, the primary source of water is flow released from Lake Spaulding through Spaulding Powerhouse No. 2 and conveyed

by the South Yuba Canal to the Bear River where it is spilled to the stream channel.

At Canyon Creek water is spilled into the stream channel for rediversion in the Towle Canal (D16N/11E-21E1), which conveys it to Alta Powerhouse. In the Towle Canal, flows are exported out of the unit at D16N/11E-31C1, approximately one-half mile above the Alta Powerhouse and Forebay. From the powerhouse to Lake Alta the canal is known as the Lower Boardman Canal. From Lake Alta to Monte Vista the conduit is known as the Cedar Creek Canal. From Monte Vista to the area south of Auburn the canal generally parallels the unit boundary meandering back and forth across it at several points. From Monte Vista to its terminus at the Roseville Regulator it is known as the Boardman Canal. The canal system is 73.7 miles in length from the intake on the Bear River to the terminus near Roseville, exclusive of laterals.

Most of the water deliveries from the Boardman Canal are made in the Auburn-Rocklin area. The principal laterals are Shirland, Greeley, Red Ravine, and Caperton Canals.

The Boardman Canal receives additional water at several points. In the upper reaches of the canal some minor recharge is obtained from Pitman Ravine (D16N/11E-9J1) above the Drum Forebay and from the Little Bear River at the Alta Powerhouse (D16N/10E-25P1), both tributaries of the Bear River. The Towle Canal rediversion from Canyon Creek includes releases to Canyon Creek made from Drum Forebay. Canyon Creek runoff below Towle Canal rediversion point is diverted by Pulp Mill Canal (D16N/10E-36Q1) to Lake Alta, thence to the

Boardman Canal. In the lower reaches, other inflow to the Boardman Canal is affected by Ragsdale Tunnel Canal, Fiddler Green-Boardman Diversion Canal, and South Canal, all units of the South Yuba and Bear Rivers Power System.

Towle Canal (D16N/11E-21E1). The Towle Canal conveys water from Canyon Creek to the Alta Forebay, leaving the unit as an export at location D16N/11E-31C1. The supply for the canal is derived from three sources: flow of the Upper Boardman Canal that is routed through Boardman Tunnel and spilled via an unnamed ravine into Canyon Creek, releases from the Drum Forebay, and natural flow of the creek. Before leaving the unit, a small portion of the flow is diverted to Crystal Springs Pipeline to supply an undetermined number of domestic users in the vicinity of Baxter.

Pulp Mill Canal (D16N/10E-36Q1). Flow in Canyon Creek not diverted by the Towle Canal can be diverted by Pulp Mill Canal directly to Lake Alta, leaving the unit as an export at D16N/10E-35J1. Thus flow from the Upper Boardman Canal and releases from the Drum Forebay may bypass Alta Powerhouse and be routed via Pulp Mill Canal directly to Lake Alta. Lake Alta regulates flows from Pulp Mill Canal and Lower Boardman Canal before releasing to Cedar Creek Canal.

Colfax Pipeline (D15N/9E-27R1). The Colfax Pipeline imports from the Boardman Canal to provide municipal service to the City of Colfax and domestic service to the urban area near Colfax. A small part of this service is outside the hydrographic unit. There are 403 connections served by this

lateral, with 390 reported as municipal and domestic uses and the remaining 13 as miscellaneous uses.

Shirland Canal (D12N/8E-15P1). Shirland Canal imports from the Boardman Canal just inside the city limits of Auburn to supply irrigation and domestic uses in the Shirland Tract, an area about two miles south of the city. The Shirland Stub, an extension of Shirland Canal, conveys excess water to Mormon Ravine. This excess water unites with tail water from South Canal and spills to Folsom Lake.

Gaylord Canal (D12N/8E-20Q1). Gaylord Canal imports from the Boardman Canal to supply irrigation and domestic uses in the western portion of the Shirland Tract not supplied by Shirland Canal. Tail water from this canal is received by South Canal and subsequently spilled via Mormon Ravine to Folsom Lake.

Monte Rio Pipe (D11N/8E-5B1). Monte Rio Pipe, a branch lateral of Greeley Canal which is a direct lateral of the Boardman Canal, imports to the hydrographic unit just below South Canal. Since Greeley Canal and South Canal are interconnected at their crossing, this imported supply can originate from either the Boardman Canal or the South Yuba and Bear Rivers Power System.

South Fork American River System

Principal water development in the American River Basin is largely confined to the South Fork American River Watershed. Significant storage is impounded in Silver Lake and Twin Lakes Reservoirs, both tributary to Silver Fork

American River, and in Medley Lakes Reservoir (Lake Aloha) on Pyramid Creek, a tributary of the South Fork American River. Water from the Upper Truckee River Watershed is imported from Echo Lake for use in the American River System. These reservoirs are operated by Pacific Gas and Electric Company mainly for power purposes. Releases made down the South Fork American River are diverted to the El Dorado Forebay via the El Dorado Ditch. From the forebay releases are made to El Dorado Irrigation District, previously described, and to the El Dorado Powerhouse which discharges back to the river channel. Downstream, flow is diverted to the American River Flume which conveys the water to American River Powerhouse where it is again returned to the stream.

Following are discussions of the diversion facilities and pertinent features of the South Fork American River area:

El Dorado Ditch (D11N/15E-24R1). Water regulated by upstream storage together with the natural runoff of the South Fork and Silver Fork, is diverted at a point just below their confluence by the El Dorado Ditch. The El Dorado Ditch extends along the south canyon wall for a distance of about 25 miles to the El Dorado Forebay, a 400 acre-foot regulating reservoir. Additional water is diverted into the El Dorado Ditch below its intake. This supplemental diversion is from Alder Creek (D11N/14E-36M1) through an 18-inch pipeline which discharges into the ditch at a point about 3 miles below its intake. At the El Dorado Forebay some releases are made to the El Dorado Irrigation District's Main Canal for urban and agricultural use,

but most of the water flows through a penstock to the El Dorado Powerhouse located on the south bank of the South Fork American River.

The El Dorado Powerhouse was constructed by the Western States Gas and Electric Company in the early 1920's to utilize the head available between the El Dorado Ditch and the South Fork American River. The present generating capacity of the powerplant is 21,000 kilowatts.

American River Flume (D11N/12E-19N1). About 5 miles below the El Dorado Powerhouse flow is diverted from the South Fork American River into the American River Flume by a diversion dam constructed by the American River Electric Company in 1903. The flume extends westerly along the north canyon wall 7.3 miles to the American River Powerhouse.

The American River Powerhouse, with a maximum operating head of 120 feet, was also constructed by the American River Electric Company in 1903. The present generating capacity is 6,500 kilowatts.

Upstream Reservoirs Releasing to South Fork. Pacific Gas and Electric Company operates a number of reservoirs located in the South Fork American River upstream area to store winter runoff for release during the low flow season. These are: Echo Lake, Medley Lakes, Silver Lake, and Twin Lakes, all constructed by predecessors of the company; Ropi Lake, Toem Lake, Lake of the Woods, and Winnemucca Lake, all constructed in conjunction with the United States Forest Service.

Echo Lake (D11N/18E-6M1), with a capacity of 1,900 acre-feet, is located in the Truckee River Basin which bounds this unit on the east. Flows are imported into the unit via an earth ditch and tunnel before spilling to the South Fork American River. The average annual amount imported during the 31 year period of record is 1,501 acre-feet.

Medley Lakes (D12N/17E-30G1), with a capacity of 5,350 acre-feet, in conjunction with Ropi Lake (D12N/17E-32P1), Toem Lake (D12N/17E-32N1), and Lake of the Woods (D12N/17E-32H1), which have a combined total capacity of about 200 acre-feet, release to Pyramid Creek, a tributary of the South Fork American River.

Silver Lake (D10N/17E-32Q1), located on the Silver Fork American River, with a capacity of 11,800 acre-feet, regulates runoff for release to the South Fork American River.

Winnemucca Lake (D10N/18E-34E1), with a capacity of 225 acre-feet, is located upstream from Twin Lakes where it regulates runoff before releasing to Caples Creek.

Twin Lakes (D10N/18E-18N1), with a capacity of 21,581 acre-feet, stores and reregulates releases to Caples Creek, a tributary of the Silver Fork American River.

All of these lakes are operated by Pacific Gas and Electric Company in conjunction with the United States Forest Service and the California State Department of Fish and Game for streamflow maintenance and power generation.

APPENDIX E

PRESENT DEVELOPMENT OF PROJECTS UNDER CONSTRUCTION BY OTHER AGENCIES

This appendix presents information on the present development of projects under construction by other agencies which could not be adequately described in Chapter I, "Local Agencies Concerned with Water Development." Only those projects in the advanced planning stage or presently under construction, but not completed at the time of the field survey for this report, are described in this appendix.

Georgetown Divide Public Utility District

The Georgetown Divide Public Utility District was organized in 1946 under the Public Utility District Act to provide for progressive development of an adequate water supply for the growing needs of the Georgetown Divide area. In 1952 the district purchased from the Georgetown Water Company the existing water system including Loon Lake in the Upper Rubicon River Basin. Those features utilized at the time of the field survey for this report are described in Appendix D.

In 1957 the district entered into an agreement with the Sacramento Municipal Utility District providing for annual payments for the purchase of the district's right to water in the Upper Rubicon River Basin. The waters secured by these rights will be used for power generation by Sacramento Municipal Utility District in their Upper American River Project.

From the funds received by the Georgetown Divide Public Utility District, storage facilities on Pilot Creek are to be constructed as a substitute supply for Upper Rubicon River waters.

As outlined in a feasibility report prepared by the district in 1958, Stumpy Meadows Reservoir would provide necessary storage facilities on Pilot Creek. Conveyance would be accomplished via a new section of conduit, the El Dorado Ditch. This ditch would divert from Pilot Creek along the south bank about one-half mile below the dam and connect with the existing Georgetown Divide Ditch at a point about 1.5 miles below its former intake.

Construction of Stumpy Meadows Project was started in 1960 and completed in January 1962. Upon completion of the project, those facilities above the reservoir and in the Rubicon Basin were abandoned and all rights to water in the Rubicon Basin officially turned over to the Sacramento Municipal Utility District.

The general plan of development includes future improvement of the Georgetown Divide Ditch from the junction with the new conduit to the Georgetown area, and improvement of the distribution system below Georgetown. As outlined in the district's 1958 feasibility report, Onion Creek Diversion is also considered a part of the Pilot Creek works. This diversion, to be located on a tributary of Silver Creek, will divert a portion of the flow in Onion Creek to storage in Stumpy Meadows Reservoir. This feature is scheduled for construction in the near future.

Placer County Water Agency

The Placer County Water Agency, created by the California State Legislature in 1957, commissioned McCreary-Koretsky-Engineers, to study possible water development on the Middle Fork American River. Findings from this study resulted in the Middle Fork American River Project on which construction was initiated early in 1963.

The initial phase of the project is the "French Meadows Complex." This includes French Meadows Dam and Reservoir, started early in 1963; Duncan Creek Diversion Dam; and the connecting diversion tunnel from Duncan Creek to French Meadows. This phase of the project is expected to be completed in late 1964.

The second phase, the "Hell Hole Complex," includes French Meadows Tunnel, Hell Hole Dam and Reservoir, North Fork and South Fork Long Canyon Diversion Dams, and the diversion tunnel from Hell Hole Reservoir to Middle Fork American River. This second phase is scheduled for completion in November 1965.

The third phase entitled "Power Facilities" includes all elements of the project necessary to make the whole of the project fully operable and is scheduled for completion on or prior to September 1966. This phase includes Interbay Diversion Dam, Ralston Tunnel, Ralston Afterbay, and four powerplants complete with penstocks.

The farthest upstream powerplant is French Meadows Powerhouse, situated on the north edge of Hell Hole Reservoir. Water to this plant is supplied from French Meadows Reservoir

via French Meadows Tunnel and discharges into Hell Hole Reservoir. Middle Fork Powerhouse, the next plant downstream, receives the diverted flow from Hell Hole Reservoir and Long Canyon Diversion Dams before discharging to Interbay Diversion Dam. Water at Interbay Diversion Dam is diverted to Ralston Powerhouse, located just above Ralston Afterbay. From Ralston Afterbay water is released through Oxbow Powerhouse to the Middle Fork American River.

Another feature of this project is Auburn Pumping Plant, located downstream near the City of Auburn. This plant will divert from the American River through the Auburn Tunnel to meet water demands in the western part of Placer County.

Sacramento Municipal Utility District

Organized in 1923, the Sacramento Municipal Utility District began electric distribution operations in the Sacramento County area on December 31, 1946. Initially the district purchased its power requirements from Pacific Gas and Electric Company, later purchasing power from the United States Bureau of Reclamation, Central Valley Project.

At the present time, the Sacramento Municipal Utility District is completing an extensive hydroelectric project in the American River Hydrographic Unit which will supply part of its power requirements. The project area is that portion of the Upper American River Watershed situated on the Rubicon River, Silver Creek, and South Fork American River below Silver Creek. The project consists of three powerplants,

10 dams and reservoirs, tunnels, conduits, roads, and a remote control system operating semiautomatically from Sacramento. The powerplants have a design capacity of 238,000 kilowatts and the reservoirs will provide about 420,000 acre-feet of gross storage.

Union Valley Powerhouse and Union Valley Reservoir are located on Silver Creek. The reservoir is supplied by the natural runoff of Silver Creek supplemented by the diversion from tributaries of the Rubicon River. Runoff from this diversion is collected, stored, and diverted in order by: Rubicon Dam and Diversion Tunnel; Buck Island Dam and Diversion Tunnel; Loon Lake Dam, Gerle Creek Dam and Diversion Canal; and Robbs Peak Dam and Diversion Tunnel.

Ice House Reservoir, one of the first features of the project to be completed, stores runoff from the upper reaches of the South Fork of Silver Creek. Water from this reservoir, plus natural runoff below the dam and water discharged from Union Valley Powerhouse, flow into Junction Reservoir. Junction Reservoir, located on Silver Creek just below its confluence with South Fork Silver Creek, reregulates this water which is then diverted via tunnel to the Jaybird Powerhouse. Discharge from this plant is reregulated by the Camino Reservoir, then diverted via tunnel to the Camino Powerhouse.

Additional features proposed for future construction below Union Valley Reservoir include a 72,000 kilowatt generating unit to be added to Camino Powerhouse. Expansion of this plant's facilities will include development of diversion

facilities on Brush Creek and a tunnel to the present Camino Tunnel. Below Camino Powerhouse on the South Fork American River, water will be further regulated by construction of Slab Creek Reservoir. Releases will be diverted via tunnel through White Rock Powerhouse, then reregulated in Chili Bar Reservoir, now under construction, and released through Chili Bar Powerhouse to the stream channel below.

Above Union Valley Reservoir in the Rubicon River drainage, four powerplants and three tunnels are additional proposed features. A tunnel from Loon Lake Reservoir would divert to Loon Lake Powerhouse No. 1, situated on the South Fork Rubicon River. Discharges from this plant are to be conveyed through another tunnel to Loon Lake Powerhouse No. 2, which will be located adjacent to the Gerle Creek Diversion Canal. Flows from this plant will discharge to the diversion canal. Robbs Peak Powerhouse, located at the end of Robbs Peak Diversion Tunnel, will discharge to Union Valley Reservoir, thereby utilizing all the inflow from the Rubicon River Watershed for power purposes.

Also above Union Valley Reservoir but on the South Fork Silver Creek, a proposed tunnel will divert flow from Ice House Reservoir to the proposed Jones Fork Powerhouse, located at the southeast end of Union Valley Reservoir.
